Hi all,
   I am looking into getting a full fledged TNC after all of the trouble
I have been having with my BAYPAC BP-1 modem. Does anyone have any suggestions

on a good one? One I have been told about is the MFJ 1274C. I am running with a Radio Shack HTX-202 and a power supply for it. As for antenna, I have a MFJ rollup J antenna. I may be getting a MFJ omnidirectional 2 meter antenna from a friend. Any ideas on TNC's? Please email me with your responses. Thank you.

Scott Barnett

>>> ADMIN
Remember, you can get copies on disk of any software or text file I refer to (including the MLHacker series) by sending me a disk and SASE. I'll put a variety of other MLHacker related goodies on there, too. MLHacker is available on the KA6ETB Internet HAM-Server. Send a message to ham-server@grafex.cupertino.ca.us with the single line of text: HELP to get access information. Check the \hamradio\newsletters directory. If you're comfortable with late-night long distance phone calls, you may download MLHacker related stuff directly from me at 509-244-9260. Use the FILES command, and L)og into the \public\computer directory. Standard XMODEM and YMODEM protocols are available. ARO related CD-ROM, Internet e-mail, and Usenet newsgroups are also available from this free service.

>>> POWER SUPPLY
Nothing, I repeat nothing, beats a schematic diagram when fixing electrical equipment. No fancy test equipment can compare. Thank you big time, Brian, for 1) recognizing my reverse engineered attempt (see Vol 17), and 2) sending me the real schematic! Two hours later... I have a dead n-channel enhancement-mode MOSFET ("K612" in case anybody can offer a cross reference). There's a 7V p-p, 500 KHz square wave arriving at

the gate. The intent is that the drain pulls current through a switching power supply transformer primary. Wasn't happ'ning. Drain stays at the +V supply voltage. Comparing with another K612 that handles the electroluminescent screen voltages confirms the first one is not working.

Several parts houses couldn't identify the K612 part, so I made a trip to Radio Shack and picked up a 276-2072 IFR510 n-Channel MOSFET. It's about twice as big as the K612, and its specifications are an over-kill, but it's all I had available. It cost just over $2.00. Instead of mounting it as a surface mount on the bottom side of the circuit board, I layed it sideways between some capacitors on the top of the circuit board and ran hookup wire to the bottom side of the board for connections. Everything works fine! A representation of the power supply pinout given in Vol 5 is in order. This time, I know functionality, too.

With the bottom of the computer removed, the motherboard still in place, pin 1 is toward the right and front of the computer, numbered like this:

```
     15 13 11  9  7  5  3  1
     16 14 12 10  8  6  4  2
```

1	5 V backup supply #1, 10-300 mA
2	BACKUP-ON request from computer, TTL levels
3	Ground (backup power supplies)
4	5 V backup supply #2, 10-45 mA
5	VEE-ON request from computer, TTL levels
6	-22 V (Vee), 10mA
7	+10 V, 10 mA
8	-10 V, 10 mA
9	EL-ON (LCD screen) request from computer, TTL
10	Li Battery +V input to power supply (~6.3 V)
11	Ground (Li battery circuits)
12	POWER-ON request from computer, TTL levels
13	Ground (hi current return from pins 15/16)
14	Duplicates Pin 13
15	5 V (Vcc), 0.25-0.6 A)
16	Duplicates Pin 15

A note of caution is in order. The computer will automatically shut down if certain voltages don't come up to specs within a few seconds (this appears as a 2 second blink of the power and numlock LEDs and the screen). Requests from the computer can be deceiving unless you know what you're looking at. For instance, I repeatedly measured Pin 9 at zero volts during my debugging. I thought the computer was erroneously not asking for the screen voltages. In fact, right when I pushed the power button, it came high for a few seconds, and then shut back off. It !was! working ok. Pin 12, on the other hand, went high to 5+ volts and then dropped back to 4.7 volts as the main 5 V supplies were shut down. This pin kept the request (4.7 volts is TTL high) active, and only dropped back to zero when I pressed the power switch once again, telling the computer to shut "off". Realize if there are good NiCads,

good Li batteries, or the external charger is plugged in, this computer never really shuts totally off.

There are three main sections to the power supply. The first handles all the 5 Volt supplies. Both batteries are brought in to this section and the normal computer supply and the backup voltages are provided from this circuitry. If pins 1, 4, 15, or 16 are bad at the power supply header, this section is malfunctioning.

The second section is where my trouble occurred. An integrated circuit regulator provides oscillation signals for the switching converter and appropriate voltage feedback control. A three-tapped transformer followed by diode rectification provides +10v, -10v and -22v. If pins 6, 7, or 8 are not at correct voltages, suspect problems in this area.

The last section is associated with the electroluminescent screen voltages, and has its own 6-pin header. To see it, open up your Minisport using the directions in MLH Vol 5 and find the 6-pin jumper going from the power supply board into the display pivot joint. Only 4 wires are used. One handles ground. Two carry current to/from the brightness control, and one is the high voltage drive for the display. Specifically:

6	50-150 VAC p-p, nominally 138 VAC
5	n/c
4	GND
3	n/c
2	return from 20 Kohm brightness control
1	diode rectified 10 VDC going to brightness control

If pins 1 or 6 !of the screen connector! are at incorrect voltages, suspect problems here. Incidentally, Pin 9 of the motherboard power supply connector (see MLH Vol 5 and Vol 17) is a TTL level request from the computer to turn the electroluminescent display on. It goes into Pin 14 of the MB3778. The MB3778 oscillator output is buffered through three parallel CMOS gates and toggles the gate of a K612 MOSFET, which in turn pulls current through a transformer. Subsequently, a high voltage step up transformer (looks like a telephone line isolation transformer) generates the high VAC for the screen.

Packing tape applied on the front and sides of the keyboard worked well to bundle the keyboard to the motherboard as I worked on the assembly. Without this, the keyboard connector ribbons get severely strained as the board is flipped this way then that way.

I am growing to dislike auto-routed circuit boards. The computer logic generates through-the-board vias that terribly confuse a person trying to trace the circuitry. In a lot of cases, casual inspection shows single side alternative routes were available.

>>> BAD ROM DISK

I received a message over Internet from a Minisport user that indicated his ROM disk (C:) has gone dead. He's getting checksum errors on boot-

up. Do you have the equipment and willingness to pull your ROM, make a copy and send it on to Ron? I ask this not just for one user, but everyone else this will eventually happen to. The source for original ROMs has dried up, and if we're going to keep Minisports working, it would be good to know who could do this for others.

>>> MEMORY SWAPS
The first MB of memory on a ZL-2 is eight discrete chips soldered on the motherboard. The second MB is a SIPP package. I know from experience the 2nd MB can be unsoldered and swapped into a ZL-1. Thomas asks if the lower and upper MB are interchangeable. Unfortunately, no. However, I would be interested in soldering a standard PC SIPP into my ZL-1 and see if the graft takes. Do you have an unused 1 MB SIPP you'd be willing to let me use?

Hi,

can anybody please mail me a hint, how to set a TNC into the KISS-Mode.
I have to do a "ESC @K" to do this.
Now I call a terminalprogram and enter the three char. I would like to do
this while booting my computer, so I wrote a little program in C. But it
doesn't work, why ??

Any help ? Send it to the adress below !

Hi All,

 I know as of recently that new News groups and mail list have been started
with HAM RADIO stuff. I am hoping someone could post a list of sites of
both these new type of groups..

Thanks in advance..

Scott,

The best TNC on the market today for ease-of-use is the KPC-3. If you
buy this it will cost you around $125 out the door. You might seriously
consider the 128K RAM upgrade as well, especially if you plan to use the
mailbox all the time.

Let me know what you get and how you like it.

Hi!

Is there any radio capable of doing all modes for packet, and also for doing normal connections throught a normal serial phone line? is fax possible to?

Cheers,
JLuis (CT1EZW)

I have never heard of such a thing. You will need a terminal node
controller and radio for packet. Any modem should work for connections
to other computers through the phone line.

You need to check the interface not the radio. look at the pactel or
any issue of qst mag there are usually several bench mark comparision
in each issue as well as ads from various companies. The fax is not
like standard telephone fax for business or character recognition.
But fasimile for wxmaps ref to arrl publications if you need some
titles ill hunt them up for you as well as issues.
My call is WB4YQS.

I have several digital signals comming over my FM radio in my area, I assume
they are FSK, What would be the best way to demodulate them?

I was thinking about using a PLL that I could tune a refrence to some
intermediate frequency and run the error voltage into some kind
of comparater or somthing close to get a digital output.

Is this a good way to do it? Does anyone know the cavets on running the
NE565 with a single voltage supply?

Also has anyone seen the FM receiver chips from motorola? They seem to
have a data output that will detect FSK modulation at any rate between
1200 and 36000 baud, how do these work? The block diagram looks like
it is done with some kind of comparater. Is this a better way to go
than using a pll?

thanx

mycal

I am posting this again just in case it fell off the newsgroup over the
holidays...

This is a tall order... so hold on tight!

I am looking for a way to take a text file of some format and submit it for
posting to a news server.

Now, I am running the DIS verions of KA9Q (The latest one I believe) and it
does support NNTP at least for incomming news but I cannot find any
specifications for outgoing such as in the SMTP support (which is absolutely
ideal).

I am using this version of KA9Q because of it's PPP support and ability to fire
scripts off at a certain time. If you know of a version that can do this as
well as what I need for NNTP, PLEASE LET ME KNOW WHERE TO GET IT!!

Anyhow, given that KA9Q won't do what I want, I am looking for a command line
utility for posting news via the network. Does such a thing exist? I

considered writing a KERMIT script to do it but I have not attempted this yet (and I am not even sure if the version of KERMIT I have will do it...BTW, where does one get the latest kermit from ... FTP site that is).

While playing with KERMIT, I tried to write a script that simply logged into my NNTP server and did a LIST but I found that I could not get it to process the commands from the script while in CONNECT mode nore could I get it to display or capture the list if I wasn't... any clues on this?

So knowing that your the NNTP wizard around here and that you probably have the perfect solution... please clue me in!

That's it.... any ideas??

Thanks,
Jon

Hi Martin. Well, I have a PK88 by AEA and I just type "KISS ON".
That's it. Be careful; it's difficult to get control back of the tnc
unless you have the right software (like NOS).

I have a program called PNEWS...but can't get it to post anywhere buy my
hard drive...

I'd also like to see a good mail program, more of a "bbs" (maybe with news and
mail that are user friendly, so I can run dial up "bbs" that'll make news and
mail runs every hour or so) and VT100 built in to KA9Q....

I tried PCELM, nice try but no cigar.

But for what I paid, I don't want to complain too much!

Phil and the such have done great work for us PPPers.

Michael, you don't mean tcp/ip do you? Are you looking for straight
AX25 packet (then why use KISS?) or tcp/ip. If the latter, ucsd.edu has
a ton of info and programs on the subject.

sorry for confusing... my problem is the following on a dos maschine:

for example i would like to use ncsa-telnet or any other tcpip package
to connect to an packet tcp/ip host via a packet driver using kiss to
a kiss_only-tnc2.

I have not found such a driver on ucsd.edu.

Thanks and a happy new year

Michael

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Internet: david@stat.com FAX: +1 (602) 451-6135
Bitnet: ATW1H@ASUACAD FidoNet=> 1:114/15

>tested for accuracy.

That's not true! It isn't because it is physically impossible in most cases.
You see, most radios either receive or transmit, but not both at the same time.
So the TNC has to store the packet completely before it is able to transmit it.
I can't imagine why a TNC wouldn't wait for the channel to be free before it
retransmits the packet, it's illogical. All I can say is that my TNCs (TNC-2S)
do wait, independent of the packet type or contents.

>Digipeating, as a mode, can be supported by most
>netrom compatible nodes. Fortunately, it can also be disabled, as it
>should be in virtually all cases.

It isn't as efficient as NET/ROM, that's true. But it's better than nothing
when there are not enough NET/ROM nodes to get where you want.

Groetjes,
Peter Busser

Well, Radio Eriwan's response would be: in principle/theory yes,
but ... the files which really cause trouble are of Jumbo size.
In order to squeeze them through HF links and to circumvent size
limitations they are split up into many smaller chunks.
It is not uncommon in the German PR network that the check list of a BBS
is flooded by some 40..70 split files used for dissemination of a single
400K SFX thing which won't sfx until all have been recorded intact.
Before that, everything received can be accounted to as noise.
Can you think of a more effective encryption than just omitting or
holding back one of these 40 parts of a large ZIPped file?
In other words, transparency is lost completely with compressed and split
files, unless a sysop reconstructs them and checks them for integrity
b e f o r e he forwards any part further. This would also make any
manipulation impossible.

An important question is, whether it is fair and feasible to put this
additional work load onto the shoulders of sysops and whether they are
prepared to do it.

Similar considerations as with split files apply to correction mechanisms.
A working FEC, when applied to an encoder/decoder, is transparent if and
only if the original data content can be regenerated immediately for one
hop, i.e. in a direct digipeater-to-digipeater or BBS-to-BBS configuration.
All long-loop applications seem vulnerable to manipulation and are also
inefficient from a systematic point of view, because they very often make
it difficult, if not practically impossible to locate the point of failure.

And then there are gimmicks like 7plus. From its first to the present
version 2.1, after more than 2 years unlike advertised, 7plus is not
capable to detect all single bit errors let alone to correct them,
despite of the publication of the underlying design error in July 91.
This is an invitation to amateur cryptographers to manipulate the two
weak bits per line to produce 2^(lines*2) permutations which remain
undetected when decoding. A professional cryptanalist would probably have
little difficulty to break this code, but at radio amateur level the
type of encryption is cumbersome to crack, although probably caused by
mere incompetence. In any case, even involuntary encryption is illegal.

I hope that I could contribute some technical arguments in favor of Jim,
4X1RU, to keep his important links clean from any 7plus and other
intransparent binary or encoded files.

Dietmar DJ4RX @ LX0PAC.LUX.EURO

If you want to answer directly, please use the packet radio address above.

p.s. I leave it as a quiz for those interested
     to find out the displacements of the two foul bits.

For a brief introduction to packet, try sending an e-mail message to
the ARRL Automated Information Server (info@arrl.org) with the subject line
Request and the following text as a message:

SEND PACKET-INTRO
HELP   (for some brief instructions)
INDEX   (for a list of available topics)
QUIT   (so your message signature doesn't cause errors)

If you have additional questions or comments after reading the packet intro,
send another e-mail message to the ARRL Technical Information Services
(tis@arrl.org) and your request will receive a prompt reply.

Best Regards, Michael Tracy, KC1SX, ARRL TIS Coordinator

I am new to packet and HAM. I do not have my Lic. yet, but am working on it.
I have, however, been monitoring packet in my local area and receive
many lines that look like this...

WB5BTZ-1>WA7KDC-2: <<RR5>>:
WB5BTZ-1>WA&KDC-2: <<I05>>:
To : JACK@ALLUS

Many times there is no other text associated with these callsigns.
Sometimes, however, I see entire conversations, but usually just callsigns.
Is there any way to monitor the actual conversation or are these people
just sending files or data that cannot be monitored?

Thanks...Win

>It isn't as efficient as NET/ROM, that's true. But it's better than nothing
>when there are not enough NET/ROM nodes to get where you want.

  This is an over generalization. Net/Rom (and it's equivalents) is more
efficient in some cases, and less efficient in some cases. It depends on
the speed of the node, the amount of other traffic on the channel, and how
far (number of hops) you are going. For only one hop, digipeating can give
you greater throughput than net/rom in most cases.

I have helped a friend load NOS onto his PC and try to get launched into
the world of TCP/IP Packet Radio. Although I was able to connect to a
couple of nearby stations by both AX.25 and TCP/IP, in neither case would
it stay connected. I think that the problem has something to do with a
conflict between the parameters set in the software and the TNC which is a
PK-232 (in KISS mode). This NOS software works successfully with an
MFJ-1278 at my station which is why I suspect some TNC ideosynchrosy.

I would appreciate any advice about how to solve the problem.

Thanks in advance for the assistance....

Hello. I am working with a couple of police departments in NorthEast
Mass. We are trying to connect both departments with a packet radio
system and Windows for Workgroup LANS.

We've applied for an 800MHz license, and started to look around for
some equipment. I went to the Ham Radio Outlet in Salem, NH and was
told that I would need some special software for the TNC -- it is
in the PK-90 -- something called 'LPAD.' When I asked what was the
difference between Amateur and Commercial TNCs (other then price),

they couldn't tell me. Does anyone out here have any idea why I can't
use an Amateur TNC in our system? Or what the difference is?

Many thanks for your time.... Chuck Wegrzyn.

I use both a PK-88 and PK-90. As far as hardware function, the PK-90
is identical to a PK-88, except the PK-90s I have only had 16K and I
upgraded them to 32K. The PK-88 ROM works in a PK-90, wala, you have
a PK-88.

As far as the (old) manual says, the PK-90 was essentially the same
as a PK-87 in terms of what it does. There was no mailbox, but I don't
think the earlier PK-87 had a mailbox either.

This may not be much help, but the pk-232 will run NOS ok.  When in
KISS mode, there are very few parameters that are set in the tnc.  Most
are set in NOS or from nos.

Perhaps by comparing the one that works with the one that doesn't you
can figure out what's different...

-Seth

MFJ also sells a rom upgrade for their TNC's for commercial use. What it does
is DES (or DES like) encryption on the data. This is almost a necessity in
law enforcement work (don't want them criminals listening in, do ya?).

Unfortunately it is illegal for ham radio work to encrypt data. Just as well,
as if a particular string of data encryted to f**k or eatatjoespizza, we
could get fined. :-) or should it be :-(I'm not sure.

I suggest that you contact MFJ for more information. They have a toll free
techincal number and the people their actually know their stuff.

73,

Geoff.

     A digipeater doesn't have an offset between the transmitting and receiving frequencies as does the repeater; otherwise it serves the same purpose.

Yes, Charles, there is such a thing as a conversion of Hi-band MICOR (gotta love 'em) to 220MHz. I have one, maybe two versions. If you give me a call at (919) 467-5787 I can provide you with more direct info. The main one I have I got from the same source as a mod. to take a UHF MICOR mobile and make it a repeater. I'll be glad to share what I have with you.

Well lets assume that your asy interface name is AX0 for a second, try
putting the following 2 lines after your attach statement in your
autoexec.nos file:
param ax0 dtr 1
param ax0 rts 1

Hello

Has anyone successfully installed the ax25 packet driver for the Baycom modem, which allows one to use TCP/IP? I am using COM 1, IRQ 4, but I am unable to get it to talk to Jnos 1.07. The modem works fine with other standard programs (SP, GP, Baycom, etc.). If possible, someone could instruct me as to which "attach" commands I need to insert in the autoexec.nos file? Any help would be appreciated.

First you load the packet driver before nos:

     ax25drv.com -b1200 -i60 -B3f8 -I4

and then in autoexec.nos you attach a packet interface for it:

     attach packet 0x60 ax0 8 256

That should do it.

  Hello and welcome to Amateur Radio and Packet.
You did not tell us your TNC TYPE , But it sounds like you have the
"MONITOR" paramater restricted.   Try the command " MON 6" if you are
using an "AEA" (ie: pk-232, pk-88 or some like that) I do not remember
the command for Kantronics TNC's but they will be similler.
Look in the manual if you have one..

Good Luck

Subject: Digital from New England to Europe; your thoughts on the best ways?
Message-ID: <CDMr4J.1sD@world.std.com>
Organization: The World Public Access UNIX, Brookline, MA
Date: Mon, 20 Sep 1993 02:05:06 GMT
Lines: 60

Greetings! I hope some folks here on the net can offer some suggestions, advice, and opinions on the following ``problem.''

I am in New England, and want to send a digital message to a friend in Slovenia. Alas, he has no Internet connection :-) ... but he is on ``regular'' (i.e. AX.25) packet.

I have been simply writing my messages on my local BBS (K1UGM), which forwards them to a regional hub in New Hampshire, which then ships them via AMTOR to a system in Croatia (which is down a fair amount), which then forwards them to Slovenia. This can take less than a day with a lot of luck; it also can (and often has) take longer than postal mail.

I'm trying to figure out what might be faster and still reliable, and have been thinking about the following:

* TCP/IP. I hear some folks are experimenting with ``encapsulating'' TCP/IP ham messages in Internet to get them ``over the pond,'' which seems nice, fast, and reliable (no worries about solar flares). However, my friend on the other side isn't on TCP/IP (actually, neither am I yet, although I will make the effort to set up and learn if it seems it will be worthwhile). Could this still work? Are there gateways I could use to send messages reasonably fast to Europe? Could I realistically (not awfully slow) telnet via TCP/IP into a BBS in Europe to forward a message? Can I send a TCP/IP message here and have it get reasonably fast to an AX.25 system in Europe?

* Routing AX.25 through NY. Most international traffic in New England is routed through the hub in NH. However, from what I've read, it looks like New York has a very nice gateway into London; and WA2NDV forwards ``twice hourly.'' I tried getting into WA2NDV myself via 2m AX.25; but through 4 digipeaters, it is too slow to be worthwhile. What about sending a message on my local 2m AX.25 board and somehow routing it to go through WA2NDV? Can I do this--tell a message on a BBS how I want it routed? Would I then I need to know an entire path also from London to Slovenia? [Please excuse me if these questions seem painfully elementary, but I'm curious and don't know]

* AMTOR myself to 9A0APL. I've never used AMTOR but have the capability (PK-232). Perhaps it's worthwhile to send my mail myself to 9A0APL via

AMTOR, instead of having the NH hub do it for me? Could I sign onto the system myself and send a message to forward somewhere else, like on a packet BBS?

* Internet/packet gateway? There's such a thing in the States, I know; but is it possible to send an Internet message to a system in Europe that would then put it back into the packet system there?

* Any other ideas? (i.e. HF packet, which I heard is terribly slow, or something else)

Thanks for your thoughts. Although what I have been doing (using the local 2m BBS) has been working, I'd really like to know more about this than just posting on a local BBS and having the messages eventually arrive, "somehow," to their destination.

73, Sharon KC1YR

Hello,

We are EcuaNet, the ecuadorian backbone for the Internet. As a non profit corporation, we provide to universities, high scools and hospitals, free access to the Internet.

Some of this organizations would like to join our network, but getting a dedicated leased line takes a while. We are thinking in packet radio as the solution for them.

We would like to invite a volunteer to help us a couple of days, designing a packet radio network, and selecting the required equiptment.

We know that there are many documents and FAQs on this subject, but, at this time, don't have available staff for doing this research.

We will pay for the round trip from the U.S. to Quito, Ecuador (4 hours from Miami, Florida), and cover all the hotel expenses for 4 days. We expect that we can work in this 2 days, and 2 additional days for touring (as a guest) beautiful Quito and its vicinities. Temperature here is close to 70 Far. (airline ticket in economy class).

Of course, we will pay taxis to and from airports and airport taxes. Our limited budget won't allow us to pay any type of reimbursment for proffesional services.

The intended network

We have Internet nodes (IBM RISC/6000 and SCO Unix) in several cities within the country. In each of them, we would like to have gateways to packet.

The volunteer will have to recomend equiptment for our nodes, as well as for the schools. He (or she) will also have to review with us the best options for the required frecuency, etc., etc.

Appreciate your kind reply NOT to the list but to xbaquero@ecnet.ec

Regards

Xavier Baquero

Keywords: wireless communication - duplexer

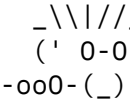
I'm desiging a wireless network for little mobile robots. It's a full-duplex
 communication. The name of my system is ActNet for robotic Actors Network.

Bibliography :
[Darche - Nowak 93] Ph. Darche, G. Nowak - "ActNet : A Heterogeneous Network of
 Actors for Learning of Parallelism, Communication and Synchronization"
 - NATO Series F : Computer and Systems Sciences - Springer Verlag - Liege
 - Novembre 1992 paru aussi en rapport de recherche MASI N° 93-22
 - Universie Pierre et Marie Curie - Paris.

I have to design a duplexer and I would like to know the way to specify this one
(attenuation and duplex spacing in particulary) from the features of the emitter
 (emitting frequency coverage and emission power mainly) and of the receiver
 (sensitivity and receiving frequency coverage mainly).

Specifications of the transmitter :

- FM modulation,
- transmitter power Po = 1 Watts maximum
- transmitter frequency coverage fo = (40-45 Mhz) and (70-75Mhz),
- output impedance Zo = 50 ohms,



Specifications of the receiver :

- FM modulation,
- reception frequency fr = (40-45 Mhz) and (70-75Mhz),
- input impedance Zi = 50 ohms,
- reception IC : Motorola MC3362-3363.

Channel spacing : 50 Khz.

Could you help me ?

Thanks in advance and best regards.

> To: IN%"WG0B@delphi.com"
> Subj: RE: Digipeater

I appreciate your response, and you (plus a few others) caught me in
an outright error. I have also figured out how I might better have
phrased my comments in a couple of other cases. Let's rehash quickly:

>>   If you would substitute "network node" (netrom node) in each ins
>>   where you used "digipeater",...
>
> I beg to differ. "A digipeater is a store and forward relay node"
> is an perfectly accurate description....

I describe how a digipeater holds data as "buffering". True store-and-
forward is a process wherein the data is available for retransmission
until it is successfully passed or the link shuts down. What is
meant by buffering is that the frame is output from the buffer one time

and then is lost. Error recovery in this case requires refilling the
buffer.

>>   Digipeating is an instantaneous retransmission mode available
>>   (unfortunately) as a "feature" on virtually all TNCs.
>
> Not so. To digipeat a packet, a TNC must receive the entire
> original packet, store it, change one bit in the address header (to
> indicate that it has repeated it), then forward it by
> re-transmitting it.

What you say is true. What I meant by instantaneous is that the frame
is retransmitted immediately without regard (or knowledge) of the
status of the next station in the path.

>>   Digipeaters do *NOT* store and forward;
>
> Yes, they do, although not at the same level of the AX.25 protocol
> as a netrom node does.

See above.

>>   they do *NOT* test the frequency prior to transmitting;
>
> The TNC uses the same timing parameters to re-transmit a digipeated
> packet as for its own packets, except that DWAIT is ignored. DWAIT
> exists to allow digipeated packets to have priority on the channel,
> but the TNC still won't key the radio for the digpeated packet if
> the channel is busy.

THIS is the error I mentioned at the top. What I should have said is

"Digipeaters transmit immediately on a clear channel without regard for
the presence of other stations."

However, DWAIT is only used by the originating station and not by any
of the digipeaters. Neither do the digipeaters use other channel
"optimizing" parms like Persistence and Slottime or the older algorithm
which multiplied TXD by a randomly selected integer in the range 0-15.
My argument against digipeating on all but the most sparsely
populated of channels is that the digipeaters tend to hog the frequency
by virtue of their priority behavior.

>>   and only at the destination station is the packet frame tested f
>
> Well, maybe, I don't know. A digipeater doesn't wait for an ACK
> packet when digipeating, but what it does with a packet with a bad
> checksum probably depends on whether PASSALL is set ON or OFF.
> Digipeating is an unconnected mode.

I should have said:
"Only at the destination station is the frame tested and an ACK sent

back over the same path to the originating station."

To the best of my knowledge, PASSALL has no effect when digipeating.
Otherwise, the problem of interference (collisions) would be compounded
by the additional "trashed" packets being forwarded which would still
be rejected at the destination.

> There are some repeaters which operate like a voice repeater: they
> receive bits on one frequency, recover the digital data, then
> regenerate the bits and retransmit on another frequency with only
> one bit time or so of delay. Perhaps you are thinking of one of
> these repeaters.

I wasn't.

>   We don't call them digipeaters here; we call
> them digital regenerating repeaters (or something similar), to
> avoid confusion.

Which brings us back to the point where this thread began. I suspect
that on several occasions your local operators have referred to the
"digital regenerating repeaters" (a real mouthful) as "digipeaters".

What I tried to say then, and repeat now, is that careless use of the
terminology (jargon) is very confusing to newcomers (and old timers,
too) and we should use caution to ensure consistency of understanding.

My error in judgement was allowing my personal bias against digipeating
as a common practice set such a strident tone to my statements.
For example:

>>   Digipeating, as a mod supported by most
>>   netrom compatible nodes. Fortunately, it can also be disabled,
>>   should be in virtually all cases.

> Digipeating is useful when a station can't hit the local netrom
> node.

I still read my last statement above to be that network nodes should
not be used to digipeat. If someone has to digipeat to uplink to a node
(a common theme in the responses) and be able to then use the network,
that is another matter.

Finally, because I didn't grow the tree, I'm just sawing the limb:

From page 2 of "NET/ROM Version 1.3 Documentation,":   "Instead of
multi-hop digipeating, NET/ROM provides true store-and-forward packet
switching."

Thanks again for taking the time to respond and give me an
opportunity to explain away my error and clarify my comments.

To everyone else who took the time to respond, I hope my explanations

here have accurately replied to your comments, too. Maybe now we can
get on to more interesting threads. Oh, and I'll wear a dunce cap
briefly for this one. <:-(

That's it for now,

>Sometimes, however, I see entire conversations, but usually just callsigns.
>Is there any way to monitor the actual conversation or are these people
>just sending files or data that cannot be monitored?

Keep in mind the the (RR) packets are small compared to the 'text' packets. MANY times, when the path to a station is marginal, you'll be able to receive the small packets (SABM, UA, DISC, RR, REJ, etc) but not be able to receive the 'text' packets. They are larger, so there is a greater chance that you're TNC won't decode the packet correctly, (longer packet lengths and slow baud rates increase the chance for you to loose a bit of info which invalidates the entire packet) and you'll never see it. Some TNCs have a PASSALL function, that will show corrupted packets. They might look ok for the most part. Depends on how many bit's were lost.

If this is the case, the messages that you see all of, should be for stations that have a good path to you. You might see one station talking to someone, but never see the other stations packets, or you might see the other stations RR and REJ packets, but not the rest of them.

I like to use an external speaker (with a switch) and monitor the freq. at the same time. You'll be able to hear stuff that your TNC won't decode. It should be noisy or weak. Some of the shorter packets will get through and some won't.

Good luck.

Hello. I am trying to decide if I can adapt Windows for Workgroups to work with packet radio. To start, let me say that I am a LAN person with lots of experience writing device drivers, etc. I am NEW to packet

radio, so if I make dumb statements please tell me -- I don't want to
spend endless hours going no where fast.

What I am going to do is write an NDIS driver to run SLIP (NDIS is one
of three types of packet driver interfaces for MS/DOS. The other two
are the FTP packet driver interface, and ODI from Novell). After having
the driver, I could then run the TNC in KISS mode, and all would be
well! (At least it would seem to be in my thinking). This would then
support NetBEUI over packet radio.

Does this sound possible? Has someone already done it? Any and all help
and advice would be appreciated.

Sincerely, Chuck Wegrzyn.

Chuck,
   You'll also have to consider the AX.25 part of your design. The SLIP

connection to the TNC will work, but your code will have to be able to convert the KISS data to ax.25 data and vica versa.
   I'd suggest looking at how to get the WFW stuff to talk to NOS. Nos is a TCP/IP implementation that has both TNC and Lan connectivity options. You could write a packet FTP packet driver interface that talks to NOS through it's packet driver interface. There are existing programs that do this. Then you could route stuff out over the radio using NOS. BQP uses a Packet Driver program that lets it talk to NOS when you run NOS in one session and BPQ in another. I think that this works under Windows and DESQview. Or you might want to talk to the BQP stuff instead of NOS. Both programs have FTP Packet driver and TNC interfaces.
   Just an idea. You should at least look at the NOS source code to get some ideas on writing the AX.25 / Kiss stuff.

You might want to try my terminal programme for G8BPQ virtual node.
You can get clear text from PACKET CLUSTER, TCPIP and NETROM packets.

It is situated in nic.funet.fi in directory /pub/ham/packet/terminal

and the file name is nwqtrm11.exe

This programme runs only with the BPQ node software.

Hello all,

can anyone tell me where I can find the discussion group for the
development of KA9Q/NOS was this group used to be before the
'reform'?
This group is great, but it doesn't seem to be that technical that we
can discuss bugs, development, experiments, and software patches for
NOS. (Flame me if I'm wrong....)

Please answer me by email

Hi,

I was wondering if there was a dialup modem facility in nos capable
of the following.

A person rings my home number, my PC is running NOS, It
autoanswers and presents the dialer with either a ftp or telnet login prompt.
From here he can therfore up/download files from my PC system at will.

If this is not available through NOS does anyone know of any software with some
such capability.

Thanks in advance.

Robin

The last couple of versions of JNOS have had something called TIPMAIL. You can start TIPMAIL up on a MODEM Port and callers will be presented with a userid: and Password: prompt when they call up. They can then use XMODEM to download binary files or use the Download command to display and capture ascii type files. TIPMAIL works with callers using standard comm programs like ProComm or TE/2.

Another option would be for them to use SLIP to establish the connection. This could give them access to the radio ports from their home system via the phone line in addition to FTP, SMTP, ETC.

Yes you can. For a simple digipeater, you need to add a manual
"arp add" entry to the arp table to include the digi in the path.

Yes they have, but not in all regions. S&F is made on Short Wave I think.
There are hams from CIS on internet too.
In Ukraine area are some nodes but it is a large country ...

I have now downloaded some 12 different versions of the KA9Q program and I still cannot find the one that best suites my needs. I am looking for support for PPP as well as a version that is scriptable, can setup timed scripts ("AT ..." or whatever), and has a watchdog facility to shutdown after nnn seconds of inactivity.

Does anyone know of a version such as this? If so, where might I ftp it from?

Thanks!

Jon

I'm wondering what versions of KA9Q NET/NOS are available for OS/2. Of
course one can run any of the MS-DOS versions in a DOS session, but I'm
most interested in 32 bit OS/2 versions. I've experimented some with the
PM version by KZ1F (see ucsd.edu:/hamradio/packet/tcpip/os2/pmnos1dx.zip).
What else is out there for OS/2? Sorry if this has been discussed before,
I will summarize if there is interest.

I am trying to configure KA9Q to accept SMTP mail and am having little luck.
I would like to set it up to accept any mail address to nnnn@xxx.mycomp.com
and place them in a file(s) for a gateway of my own design to process. The
"nnnn" and "xxx" can be anything, I will do the validation via my gateway.
Could someone PLEASE PLEASE send me the appropriate SMTP and/or MBOX commands
to get this to work? Of course I'd like to send mail out of KA9Q too...*grin*

Any ideas?

Thanks!
Jon

I am a newcomer to packet and want to start out just "reading the
mail" for a while. I am using the simple interface that Bill
Nolle sells and a AT class pc. My question is: can anyone
suggest some decent software I can use to first monitor and later,
once I get the hang of packet, to Tx as well?? I have PKTMON now
which allows pure monitoring but I'd like something simple (if
possible) which will TX too.
Part II - I have an old Azden PCS4000 2 meter rig which I'd like
to use for my packet. Can anyone give any tips re the interfacing
for this rig?? Any help would be much appreciated.

In the Southeastern Wisconsin area, we are trying to upgrade the backbone from 4800 baud to 9600 baud. My problem is, a Kantronics data engine, an MFJ 1274, an MFJ 9600 baud modem, a deviation of 3 KHz. all at about 200 ft. doesn't work! 4800 baud works fine!

We are using Icom 3200's as part of the 9600 baud network. They talk to each other!

I'm open to any suggestions to get this Kilobuck project resolved. We don't have a path problem, this isn't working on the bench! Is there something I've overlooked?

Has anyone had problems with the Data Engine?

I have been working on a new service for KA9Q. I started to work with KA9Q
Version 911218. Which KA9Q or NOS should I use if I don't want to lose my work.
Which recent version of the KA9Q is most compatible that old KA9Q and hopefully
less buggy?

Thanks!

       What everybody in the "digital encryption vs compression
  schemes" debate seems to miss is that the rules on encryption
  were written by Lawyers not Technicians.

       In the United States, Part 97.113.d states in part:

     (d) No station shall transmit: music; radiocommunications or
     messages for any purpose, or in connection with any
     activity, that is contrary to federal, state, or local law;
     messages in codes or ciphers where the intent is to obscure

the meaning (except where specifically excepted elsewhere in the Part);...

I think this has been said before, but it bears repeating. A CODE IS A CODE ONLY IF YOU USE IT TO HIDE WHAT THE MESSAGE IS SAYING.

The key word in this section is "INTENT" Under the law, intent is of utmost importance. If I transmit a message, in CW, Voice, AMTOR, Packet, Clover, or whatever, if I do not intend it to mean something other than what it says then it isn't a code. No matter in what mode it is sent or what compression schemes or encoding are used to facilitate sending it. If I wanted to take all the message traffic off my PBBS and compress it with PKZIP, UUENCODE it, and then send it by TCP/IP SMTP with LZW compression, using CW, that is legal. As long as my "INTENT" was not to obscure the meaning. State of mind must be shown in any prosecution of this section. The FCC must be able to show "to a reasonable person" that is was in my mind that the above process would obscure the meaning of the messages so as to hide their meaning.

If, on voice, I call you and say "Hi Jim! The sun sure is bright today, do you think it will rain?" If that is what I meant, then all is well. If, on the other hand, I had agreed with you that when I asked that it meant, "Meet me at the Coffee Shop at the corner of Third and Ash Street in 15 minutes, I've got some juicy gossip to tell you." Then that is a code and is illegal. If I wrote that in a message and compressed it before sending and sent it to you via packet, the same rules apply. If I sent you 14 different messages each with one word in them and numbered consecutively and you had to reassemble them at your end, as long as my "intent" was not to obscure or hide the meaning of the messages, then that is not a code and is legal, at least here in the USA it would be. Not saying that I wouldn't have a lot of Hacked Off Sysops sending me Flamethrower-grams in return for clogging up the network. But that is a different thread!

I am wondering if there is a better source, or a complimentary source
of information regarding AX.25 protocol. The ARRL "booklet" is ok
for describing the basic ingredients, but it is sadly lacking the
details necessary for someone to actually implement AX.25.

What would help a lot, would be a STATE DIAGRAM for its operation like
the X.25 CCITT documents had, as I recall. I no longer have access
to the X.25 documents, and I suppose the AX.25 doc presupposes
access to the former. This is ok I guess, but its just darned
inconveniant to the amateur community. Purchase of the red(?) CCITT
books is vy expensive for us poor hams.

I'd be interested to hear of other more complete book references, or
"cheaper than CCITT" docs that would help. Maybe somebody with access
to the X.25 red book can cook up an ASCII state diagram and post it.

I would omit the disconnect/connect state diagrams because of their
differences with AX.25. However the INFORMATION phase should be
identical, or almost.

     Also, if you know the exact fasicule # required for the
*   X.25 book with the state diagrams in it, perhaps I can   *
     beat up on our local library to get it. Who knows?

Tnx in advance.

  The 7th ARRL Computer Networking Conference proceedings has SDL
for ax.25. It's got a couple of bugs in it as I recall, but it's
a great place to start.

I am getting into packet radio and would like to locate a comm program for

the PC that speaks the text that is printed to the screen. This would
come in very handy for monitoring packet while working at other
applications on the PC. I know there is a program like this for the
Amiga, but I have not seen one for the PC. Something that uses a
sound board would be especially nice.

Please e-mail...

Thanks...Win

During the last few days I have read on packet radio or on the Internet

many complains about 4X1RU. It seems that this self-important packet baron,
who has managed somehow to be the main forwarding BBS for Europe, keeps a
60 K reject file on his BBS and decides whose message will pass and whose
not, contrary to the amateur radio spirit of good will and mutual support :-(.

I noticed that some forwarding stations are afraid even to discuss the
subject openly, afraid they will be blacklisted as well. While I do understand
their fears, I cannot understand why they insist using his BBS for
forwarding. After the latest revelations they should have isolated him.
I can't see why half the european packet traffic should pass via a
_non_european_ station. What is so special about 4X1RU? Is he more clever?
Does he have a better antenna? Does he run more power? Is he using better
software? Does he have green hair and pink eyes? Or what? :-)

I have tried to use TheNet 2.10 for a back to back Tiny2 node by using
the wiring diagram in the Tiny2 manual. Using that information the
nodes work independently, but do not recognize that they are wired to
each other. I have called PacComm. They are no help. I do not have
ANY documentation on TheNet. The units work FINE when addressed with
the standard PacComm chip attached to my computer OR when attached with
2.10 to a "node stack" with NX2P hardware. How do I CORRECTLY attach
two Tiny2 units together "back to back" with TheNet and create my
intended node?????

In article <1993Sep13.031728.22916@uxmail.ust.hk> ee_hflo@uxmail.ust.hk (ee_help)
writes:
>   How a digipeater work ? Is it same as a repeater ?

A digipeater is a store and forward relay node. Unlike common repeaters,
it does not retransmit what it hears until it has received the entire
frame, validated it, and determined that the frame is requesting the
particular node to retransmit it now. This information is in the AX25
header of each frame.

Amateur digipeaters normally operate in simplex mode on a single
frequency, alternately listening and transmitting, though they can
be used on split frequencies. Repeaters normally operate on two
separate frequencies in the same band, or crossband, and repeat in
realtime, or near realtime, everything they hear on the input channel
to the output channel. They may or may not use bit regeneration, but
they do not validate the frame, nor do they check to see if they are
being requested to relay the frame.

Repeaters have several advantages over digipeaters, and a few disadvantages.
Because the digipeater has to receive the entire frame before it starts to
retransmit it, it takes 2X+ the channel time of an unrelayed frame. A repeater,
because it repeats in realtime, doesn't slow down the frame relay except for
some initial keyup delay at the start of activity. Thus a digipeater cuts
the effective throughput of a channel in half while a repeater does not.
A repeater offers another more important advantage. It allows every station
to hear every other station. This is because all stations transmit on
the repeater input and listen on the repeater output. Everything the
repeater hears, every station hears. This eliminates a problem called
the hidden terminal problem which is the bane of simplex digipeater
operation.

Because digipeaters and repeaters are sited at preferred locations, often the highest spot around, they hear every transmission made in the area. Because user stations generally aren't in such preferred locations, they generally don't hear most of the other stations on channel. This can result in collisions because several user stations may key up on top of each other because they can't hear each other. But the digipeater can, and what it receives is then just a scrambled mess. So it won't retransmit *any* of the frames being sent. Since packet is an ARQ protocol, all the user stations will continue to try to send their frame, and will continue to collide and little channel throughput will occur. This problem is greatly reduced by a repeater. Since every station monitors the repeater output, they hear every other station on the network. So if another station is transmitting, they will refrain from transmitting until the other station finishes it's transmission. This solves the hidden terminal problem and greatly increases the channel's effective capacity.

Now I mentioned that repeaters have some disadvantages. The first should be obvious, two frequencies are used instead of one. This is offset by the higher utilization the repeater offers. The second disadvantage of the repeater is that if it fails, all stations on the network are out of service even if they were in simplex range of each other. This is because they aren't listening on the frequency on which they are transmitting. An operator must intervene and change the frequencies of the radios to maintain partial network operation in case of repeater failure. Repeater owners usually go to great pains to maintain reliable service so this usually isn't a serious concern.

You might get more response if you mention your email address. Many
of us read the news posts as digests from ucsd.edu and a lot of the
message header is deleted to save space. The "From:" line on your
message is about 80 chars of site!site!site!site...

                                    Thanks and 73,

Don't blame the originator. The digester need a little work! It moved the 'Path:' line information which is NOT supported for mail purposes to the 'From:' line! The original headers (broken for clarity) follow:

: --
Peter,

You will find that the following frequencies are used in Europe for
packet: 144.625, 144.650. 144.675 . The Netherlands is one of the European
countries where TCP/IP has it's strongest foothold, you can get from end to
end of the country on TCP/IP as far as my information reaches.

The use of 2m (144-146) for packet is shunned a bit, most activity takes
place on 430-440 Mhz. Higher speed modems are getting VERY popular,
4800 baud is available on most acces points, 9600 is wide spread for
backbones.

All of this info is second hand, being an expat myself I have no direct
view on the latest developments.

Cheers

Carl,

  I suggest you run KA9Q's TCP/IP NOS with the Converse bridge compiled in. I have JNOS110x9, by Johan Reinalda, WG7J, and it has a lot of nifty features. You can pick it up via anonymous FTP from ucsd.edu. I think it's in \hamradio\packet\tcpip\wg7j or \hamradio\packet\tcpip\jnos. The version listed as JN110X9s.ZIP is the source files and JN110X9X.ZIP has the executables. There are also some docs.
   If you've never tried running NOS before, I strongly suggest you find a local "Elmer" who has (it can have a near-vertical learning curve!), or at least FTP a file called 1229_NOS.ZIP (or something like that), which is a basic doc file for the PA0GRI compilation of NOS (WG7J NOS is based on PA0GRI's mods of the original KA9Q code). Another good starter package is NOS View (NOSVW304.ZIP) by Ian Wade, G3NRW (author of the book "NOSIntro"), a self-extracting, semi-self-configuring NOS package that helps you get a TCP/IP packet station up and running for starters.

   NOS lets you (and users) run FTP, Telnet, SMTP, Callbook, NetROM, Conference Bridge, and many other servers via packet radio, and can be gatewayed or wormholed via Internet, etc. (Too much to cover here!) You run it on a personal computer (there are versions for MS-DOS, Mac, Unix/Linux, Sun, OS/2, etc), with any standard TNC that will run in KISS mode. It can run multiple ports, landline modem (with a Serial Line Interface Protocol "SLIP" port) and can be configured as a full-service forwarding PBBS that talks to other TCP/IP users or "plain" AX.25 packet ops.

First, you need SoftKiss which is a serial driver replacement. It drives
the BayComm or PacketMac modems and emulates a KISS TNC.

Then you have exactly two (to my knowledge) choices for application.

1) Savant - An AX.25 program that provides a multiple-window split screen
   true Macintosh GUI. Every time you open a new connection, a new window
   opens for that connection. Switching "channels" is as easy as clicking
   on a window to bring it to the front. Savant is smart enough to route
   all incoming packets to the right window and vice-versa. It also has
   other nice features like a Stations Heard window which constantly shows
   you the most recent 64 stations heard on the air, and how many packets
   they have recently sent, etc. Savant works with any TNC with KISS mode.

2) Net/Mac. A program written for a DOS machine, and ported to the Mac.
   It is hard to get working, and provides a terrible user interface, but
   it does tcp/ip.

I may be a bit biased, as I'm the author of Savant. :)

A digipeater works basically the same as a repeater, but on a smaller
scale. In packet as you know we have devices called a "tnc". Think of
this as a small repeater. I don't remember right off where you are
located, so I will give an example. Say I want to connect to a ham
located in Los Anegeles, and I am located in San Diego. I am not ablke
to connect direct to him direct, so I connect to him via someone else.
For example, the person I am calling call sign will be wa6abc, the
person I will be digipeating thru is wa6cba. I would type out
c wa6abc via wa6cba. So actually wa6bca is actually acting as a
repeater. Hope this helps out. 73, Tuck, KC6ZEC

>   How a digipeater work ? Is it same as a repeater ?

You wrote:
> A digipeater is a store and forward relay node......

If you would substitute "network node" (netrom node) in each instance
where you used "digipeater", your answer would be reasonably accurate.
It's no wonder newcomers are confused when even the "experts" don't know
to use the correct terminology.

Digipeating is an instantaneous retransmission mode available
(unfortunately) as a "feature" on virtually all TNCs. Digipeaters

do *NOT* store and forward; they do *NOT* test the frequency prior to transmitting; and only at the destination station is the packet frame tested for accuracy. Digipeating, as a mode, can be supported by most netrom compatible nodes. Fortunately, it can also be disabled, as it should be in virtually all cases.

That's it for now.

>CORRECTLY attach two Tiny2 units together "back to back" with TheNet
>and create my intended node?????

First, the documentation files are bundled with the program for TheNet and the ones which come with TheNet 2.10 are especially good. You should get a copy for all of the other information they contain as well as how to hook up your TNC.

However, the good news is: "The Pac-Comm Tiny2 TNC comes TheNet ready. It may require a more complex DCD modification kit, also available

from TAPR." from TN210-5.DOC

The DCD modification kit description is:
"For the TNC-2 or clone, the VHF modification is extremely simple. It consists of adding a capacitor and two resistors to the circuit board: Replace R-73 with a 180K ohm resistor. Place a 180K ohm resistor paralleled with a .01 Mfd capacitor on the underside of U-20, between pins 3 and 6.
"   Note: To perform the above modification, it will be necessary to de-install the TNC circuit board. An alternative method of doing these mods would be to purchase a TNC DCD modification kit from the Tucson Amateur Packet Radio Association (TAPR), Telephone (602) 749-9479. Specify the TNC model number when you order." - ibid.

The only other thing I might point out is that for connecting two TNCs together, it is necessary to swap pins 2 and 3 (TXD and RXD) on one of the two connectors (null modem type connection) and BOTH connectors must jumper pin 10 to pin 23. At least, that's the case for a plain TNC2 such as an MFJ1270.

I don't have a convenient way to ftp the 2.10 files, but imagine you can find the zipped version in the hamradio directory on ucsd.edu.

Hope this information gets you going.

That's it for now.

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to add the groups created during the latest reorganization vote and the description of the cs.utexas.edu gateway.

History

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as

well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home

(that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I think Gary was right...

>Digipeating is an instantaneous retransmission mode available
>(unfortunately) as a "feature" on virtually all TNCs.

No TNC I know of "Instantaneously" retransmits what it hears. They all listen
to the the entire frame, STORE it (of course), mangle the header appropriately,
and then queue it for transmission. Most software can be configured to give
digi'd frames a "higher priority", ie they get sent sooner than ordinary frames.

>Digipeaters
>do *NOT* store and forward; they do *NOT* test the frequency prior to
>transmitting; and only at the destination station is the packet frame
>tested for accuracy.

They DO store and forward, and they DO check the frequency (by default anyway).
Not that on most TNC's you can disable the frequency checking. BAD idea!

What you are describing is the output from a modem attached (usually via
some more hardware) to the input of another modem.

If your description was right, then every TNC with digipeating enabled would
retransmit *everything* it heard. Can you imagine what the effect would be?

>Digipeating, as a mode, can be supported by most
>netrom compatible nodes. Fortunately, it can also be disabled, as it
>should be in virtually all cases.

Sure, but not in the 'instantaneous' way you describe.

A Network Node (ie netrom, or netwrong as many would have it) does a
completely different thing. It takes layer 2 frames from the user and (often)
packages them into layer 4 frames to send to other netrom nodes. The remote
node does the opposite. Netrom nodes support digipeating too (STORE AND FORWARD)
but lots of 'em have it turned off.

I am looking for someone who has had experience with connecting a Poor Man`s
Packet
modem to a Radio Shack HTX202 2 meter HT.

I have been using this PMP modem with an ICOM 02AT for over a year without any
problems. When I try using the HTX202 with this same PMP modem, it won`t key the
radio. I know that the mic plugs are the same because I use the same speaker mic
on
both rigs. By the way, I can receive packets with the HTX202.

Any help would be greatly appreciated.

>should be in virtually all cases.

Unfortunately it's *you* who is confused. Digipeating *is* store and
forward. The frame is not relayed until it has been completely
received, checksummed, and the header inspected to see if the frame
is requesting relay by the digipeater. The digipeater then obeys

channel access protocol and waits until the channel is free, within
the limits of hidden terminal syndrome, before retransmitting the
frame.

A Netrom node behaves somewhat similarly, except that it transmits
an immediate acknowledgement to the originating station before
retransmitting the frame now encapsulated in a Netrom frame. Netrom
offers automatic routing rather than depending on the source routing
of digipeaters by establishing a circuit table internally. What
netrom does *not* offer is end to end acknowledgement that a frame
actually reaches destination. It only acknowledges that *it* received
the frame from the orignating station. It will teardown the connection
after a time if it fails to deliver frames, but that gives little
information to the originating station about the status of the transfer.

Netrom is useful, thanks to it's auto routing and hop by hop acknowledgement
internally, but it's not fundamentally different from the operation of
a digipeater in that it too is a store and forward node.

Gary

Sorry, I didn't intend to blame anyone. I merely wanted to mention to
the sender and the net that by adding your own reply email address is
a good idea if you want people to email reply to you.

It is not just the digester that makes it hard to respond direct, some

people have very confusing uucp paths too.

By the way, thanks for including the originator's email address for me.
Now I can reply to his note and volunteer my assistance. :)

And you're one of these experts?

>Digipeating is an instantaneous retransmission mode available
>(unfortunately) as a "feature" on virtually all TNCs.

  Wrong. Digipeating is not instantaneous.

>Digipeaters do *NOT* store and forward

  Wrong. Digipeaters *DO* store and forward.

>they do *NOT* test the frequency prior to transmitting

  Wrong. Digipeaters *DO* test the freq prior to retransmitting

>and only at the destination station is the packet frame
>tested for accuracy.

  Right. Only the destination station does a CRC check and ack's the frame.

>Digipeating, as a mode, can be supported by most
>netrom compatible nodes. Fortunately, it can also be disabled, as it
>should be in virtually all cases.

  Not necessarily. There's a lot less overhead by simple digipeating.
The distinction between digipeater and node is in the acknowledgement
packets, and path finding. A digipeater simply passes the frame on
to the next digipeater or the destination. The destination station is
responsible for sending an acknowledge packet back, which gets digipeated
back to the source station. Nodes give a local acknowledgement of the
packet when they receive it. That way, the destination has to only send
the acknowledgement back to the last node. There's a lot less chance of
a lost packet slowing you down.

  But in a clear channel, digipeating is more efficient if you only go
one or two hops. If the chance of packet loss is very low, this is more
efficient because the message bounces straight through to the destination,
without having to wait for a local CRC check and acknowledgement. I have
seen many cases where simple digipeating has a higher throughput than a node.
The there are also cases where a node has higher thoughput. It depends on
your environment.

This is incorrect. If a digipeater receives a frame with an invalid FCS (I
assume this is what you mean by the packet frame being "tested for
accuracy"), it does what any other packet TNC does - it discards the frame.
The main difference between digipeating and NETROM or ROSE(or, for that
matter, KA-nodes) is that with digipeating there is no provision for
link-by-link acks.

I had a similar problem with an mfj tnc. I called mfj and was told to
use a 3.3k, or if that did not work a 2.2k, resistor instead of the 48k
or so one used for Icom.

If I remember correctly it goes between ptt and the radio's audio in.
BTW this cable also works fine with an Icom ic-2sat.

Try reducing the value of the keying resistor. An Icom will often key
reliably with a 10k "leak", but Yaesus, and probably HTX202s, need a
lower value. 2k works well with the Yaesu FT-470.

Sorry, wrong. Each digipeater does a CRC check before it even looks to see if the digipeat bit is set in the header field. Digipeaters don't repeat garbage frames. Quoting from the AX25 Link Multiplexer State Machine spec, "The physical layer SDL machine provides incoming frames to the link multiplexer SDL machine via Frame primitives. The link multiplexer SDL machine checks each incoming frame for FCS errors. Correctly received frames are checked to see if digipeating by the station has been requested and if the digipeat function is enabled. If so, the frame is resubmitted to the physical layer SDL in a Digipeat Frame primitive."

ftp.demon.co.uk *does* exist because I put X1J on there. I would guess that
you must have tried it today while the machine concerned was down for an
upgrade. The address of the machine is 158.152.1.65 if you want to try
again. AFAIK it is open for anonymous access to all - I logged in as
anonymous quite happily.

Note that most *.demon.co.uk nodes are dial-up (anything 158.152.8.* and
higher) users like me and so won't be accessible 24hrs.

No, half-right. Only the destination station acks the frame, true, but
any TNC(whether acting as digipeater, end-point, node, or whatever) that
receives a frame which fails the FCS check discards that frame - that
frame never even gets to the point where a digipeater would check it for
a request to digipeat. Any frame that a station digipeats has to have
passed the FCS check before that station could have sent the digipeated
frame.

As is typical in such situations, my previous post is now out of date! In
the upgrade on Saturday, the Demon team shifted a few things about.....

>Saturday to perform the upgrade. Please note that ftp.demon.co.uk is
>a CNAME which is likely to change from moment to moment. Also that
>gate.demon.co.uk is no longer the ftp server.

This morning it was responding with the address 158.152.1.68.

Incidentally, our first local X1J nodes have now been running a while with
no hitches and passing a fair amount of traffic.

Dave

In packet-radio digest #270, Doug Thompson, WG0B writes:

>However, the good news is: "The Pac-Comm Tiny2 comes TheNet ready.
>It may require a more complex DCD modification kit, also available
>from TAPR." from TN210-5.DOC

>The DCD modification kit description is:
>"For the TNC-2 or clone, the VHF modification is extremely simple.
>It consists of adding a capacitor and two resistors to the
>circuit board...."

The TAPR 2211 DCD kit for TNC2 or clones actually makes slightly more
of a modification than this, although for VHF use, this mod (or in
some cases with the TNC2 no mod at all, will do fine. The kit
also has the capability of installing a threshhold control which
is useful mainly for HF.

The Tiny2, however, does not use the XR2211 demodulator, but a
TCM3105 modem chip. This requires the "state machine" DCD kit
available from TAPR, not the resistor/capacitor changes Doug
described. It's a simple board to build and interface, and will
work with practically any TCM3105 or AM7910 modem chip.

Wrong, digipeating is not instantaneous, it does wait for the frequency to
be clear before keying up. Parameters can be *poorly* set so that a
digipeater keys up right away, but that's an IQ problem. Digipeaters *do*
check the packet for accuracy (CRC check) before retransmitting the
packet. If the packet is corrupted it's ignored and the originating
station will generate a new one eventually.

>Digipeating is an instantaneous retransmission mode available
>(unfortunately) as a "feature" on virtually all TNCs. Digipeaters
>do *NOT* store and forward;

Incorrect. The packet is stored in memory, the repeater field in
the header is updated to reflect that the packet has passed through the
digipeating station, the checksum is recalculated, and the packet is
queued for transmission.

>they do *NOT* test the frequency prior to

>transmitting;

Sorry, this also is incorrect. A digipeater is required to observe the
channel and not to initiate a transmission if the channel is busy.
In obsolete software still using the 'DWAIT' option, the digipeated
packet is not required to wait the minimum 'dwait' time that locally-
-originated packets must wait, but the station is NOT permitted to
transmit any packet at all if the channel is observably busy.

>and only at the destination station is the packet frame
>tested for accuracy.

Also incorrect. The checksum (CRC, actually) is checked when the packet
is received at the digipeating station, and recalculated before the updated
packet is sent onward.

It is true that there are no intermediate acknowledgements with
digipeating; acks are end-to-end, which may be what you were thinking of.

>Digipeating, as a mode, can be supported by most
>netrom compatible nodes. Fortunately, it can also be disabled, as it
>should be in virtually all cases.

Agreed. Digipeating is a waste of bandwidth and should be discouraged.

>That's it for now. Doug Thompson, WG0B

I don't understand this aspect of the list world. I need some basic help
 understanding the lists that are moderated.
 How do I get on the new list?
 Do I subscribe in the usual way?
 my mail such as this message is always delivered, but I never see
 my mail on the list.
 No one ever replys to my cries for help.
 The list is insteresting, but I need to know more about the
 inner working of it to be useful.
 Ken

  Yep, you're right. Each digi does a frame integrity check. Oops. :)

I need help with the following;

I have set up a DRSI PCPAT card according to the instructions in the
FBB manual. I am using the 2.1 version of the driver. This is the
oldest version that can be used according to the manual. The DRSI
card is made 1989. When trying to start up the FBB BBS I get
Resync errors and the program terminates.

Does anyone have any idea of what may be wrong ?
I am grateful for all suggestions !

   I guess I should have been a little more specific. It needs to run
on an IBM compatible. DOS, Wind*ws or OS/2 are all available for use
on the machine(s) this person can access.

   Any leads using this additional information are appreciated.

   Thanks in advance.

I believe there is a piece of software named Packet Tracker (?spelling)
for the Macintosh that will automatically generate the links in a packet
network. Not sure if it is avaible from ftp. I am pretty sure I have
seen it advertised in the magazines lately.

I used to own a W2A and used it successfully on Packet. I called ICOM and they faxed me the schematic for constructing a connector to the W2A for packet. I dont have the fax anymore (gave it to the purchaser of the W2A) but you can call ICOM Tech Support and they will fax it to you.

btw, the cable I made was for the KPC-3 and I have no idea if the connector on your TNC is the same, but I will sell you my cable for what it cost me to make it & ship it, say $10. It has the W2A size plug on one end and a metal DB9 connector on the other end. Inside the DB9 is the resistor and capacitor you need for the PTT wire like the FAX illustrated.

73 Bob

netwalker which is included in the w0rli package will do this. It provides
raw data and has to have human intervention to make a reasonable map out of
the results.

In the file "Baycom.doc" the author makes reference to a DCD add
on circuit:

CARRIER DETECT WITH XR2211

DCD Diagram Here

Analogue - DCD with XR2211 for 1200/2200 Hz

The design of the Circuit consists of known principals, for problems
with

it see also the already mentioned script MODEMTECHNIK FOR THE
FUNKAMATEUR.

Every time when the PLL is not active, the received Data is able to be

suppressed, it is able to be worked therefore, with open Noise
suppressor

(Squelch). Typically the XR2211 requires approximately 4mA, that is, it also

possible for this to be supplied from the Serial Port without problems.

but the diagram is missing- Does anyone have the schematic, diagram, or information? Please post or e-mail it to me....

Also - Has anyone used a baycom type design on a Amiga? With so many Amiga's in Europe, has this been done? Please let me know! Thanks 73

Great idea!
I just bouught one of those Baycom packet modems. I do normally run under
windows but Baycom does not do well running in a dos window.
I hope some guru out there works up a windows package.

A suggestion:

Someone just started distributing a land-line bbs software package written
with Microsoft Access Basic, which is essentially Microsoft Visual Basic.
Supposed to be the new hot setup, no more TSR's and a built in database
program for handling all that mail and so forth.

Maybe that's the place to start.

DATA THROUGHPUT ON PACKET - a difficult concept

from ZL1DDL

In some recent discussions with fellow packeteers I had to realize that there is a lot of talking about 'throughput' of certain systems, or under certain channel situations. But do we really know what we mean when we use the word ?.

Let's start with a simple example : you're logged into a BBS on a direct user access frequency. Let us also assume that you're alone on the frequency (except for the BBS) and that your link is so good that no packet gets lost due to noise. Now imagine that you're issuing a 'R 1234' command to download the bulletin number 1234. What will happen ?

First (BayCom users and some others can see this on their monitor screen), your station will send an info packet to the BBS. It will consist of the 'R 1234' the data, which accounts for six bytes, and a header of about 20 bytes. This is the packet's information content. So we have about 26 bytes, eight bits each, which gives us around 208 bits. Ready for transmission ? Not quite. Before the frame can be sent out, another process takes place: bit stuffing.

Why that ? Well, the receiving TNC needs some means of actually synchronizing itself with your baudrate, which may differ slightly from 1200 Hz. For this, it needs a regular feature in your bit stream. In our case, that's provided by a zero bit which is inserted after each five bits. 'One' bits are always transmitted as a continuous tone while a 'zero' is denoted by a change between the two tones. This way having a regular 'zero' transition occuring, the TNC receiving the packet can synchronize itself with the transmission.

To account for those extra bits, we need to add another 20 per cent to our bits, which leaves us with about 250 bits in the frame. Luckily, this 'packing' process takes almost no time in a modern computer or TNC, so we'll neglect this delay for a moment. Transmitted at 1200 Bd the packet itself will take 208 ms to get transmitted. But stop - that's not all: before transmitting, your TNC will wait about 100 - 300 ms for a clear channel (assuming that the BBS has almost zero TX-RX switching time), and only then it will key up. Most packeteers use DWAIT to control this.

Hm, we're still not on air. There is this dreadful other parameter, called TXDELAY. With a modern rig and a software squelch on both sides this should be no longer than 200 ms, to cover the time your transmitter needs to key up. Bingo: our transmission has taken place. It has taken us over 700 ms to transfer six bytes of data (well, make that seven with a RETURN at the end...). This is a bit rate of just about 80 bits or 10 bytes per second. Not a good through-put, one might say. Actually, the figure is almost meaningless - what you're really interested in is how long it takes to get a reply from the BBS:

(to be continued)

Title   : ZL DATA NEWS SEPT 05 2/3

CHRISTCHURCH JOTTINGS
---------------------   SENT BY ZL3CS
   AT A RECENT SPECIAL GENERAL BRANCH MEETING OF 05, A GENUINE ATTEMPT WAS MADE TO CLEAR THE WAY FOR ACCEPTING CLUB ASSOCIATES. IN THE CHAIR FOR THIS SPECIAL OCCASION RON, ZL3VX HANDLED A DIFFICULT TASK ABLY AND SMOOTHLY. A DRAFT OF A NEW CONSTITUTION FOR THE CLUB WAS FINALLY COMPLETED SHORTLY AFTER 10 PM. A GENERAL MONTHLY MEETING FOLLOWED BY A WELCOME CHEERFUL CUPPA COMPLETED THE EVENING. HAMMERING A NEW CLUB CONSTITUTION INTO SHAPE, IS NO EASY TASK AND THE MAIN BLACKSMITHS, ZL3VX AND ZL3FU, MUST BE COMPLIMENTED ON PRESENTING A DRAFT COPY, WHICH REQUIRED ONLY FINE TUNING TO BE ACCEPTABLE TO SOME 30 PLUS CRITICAL,INTERESTED MEMBERS. THE ATTENDANCE WAS DOWN BY COMPARISON TO THE USUAL NUMBERS DRAWN BY THE EVENING TOPICS. A FURTHER REPORT CONTAINING SPECIFIC INFORMATION ON THE CONSTITUTION UP-GRADE SHOULD BE AVAILABLE, AT A ROUGH GUESS, ABOUT CHRISTMAS TIME.
73 DE GUTHRIE.

PACKET CHANGE TO 80 METRES
--------------------------   from ZL1AQ

WITH CONDITIONS SO POOR ON 40 METRES A CHANGE TO 80 METRE PACKET WOULD SEEM TO BE THE RIGHT MOVE.RECENTLY SELCAL(BAUDOT) WAS SHIFTED FROM 40M TO 80M AND THE RESULT HAS BEEN FAR BEYOND EXPECTATIONS.
PACKET ON 80 METRES COULD BE RUN BETWEEN 3630 AND 3640,TO SUPPORT THE SUGGESTION ON PAGE 97 OF THE CALL BOOK.
SOME OPERATORS MAY WISH TO USE 3635.5 OR 3638.9-A SIMILAR PATTERN TO 40M. TO GET THE CHANGE OFF THE GROUND IT MAY SAVE PERSONAL TIME IF CALLS ARE MADE RIGHT ON THE HOUR,ESPECIALLY 8 O'CLOCK ON.

73 DE GORDON ZL1AQ.

WHERE ELECTRONS GO
------------------ FROM ZL1ACS
(DEDICATED TO THE NEWCOMERS GETTING TO GRIPS WITH RADIO THEORY.)

   THE PROCESSION OF ELECTRONS PAST ANY GIVEN SPOT,
   IS CALLED ELECTRIC CURRENT AND IT MAKES RESISTORS HOT.
   IT ALSO HAS MAGNETIC FIELDS WITHIN IT AND AROUND,
   AND WE ALWAYS SAY THAT CURRENT GOES FROM POSITIVE TO GROUND.
   BUT NOW WE KNOW THERE'S PLENTY OF ELECTRONS IN THE EARTH,
   SO POSITIVE POTENTIAL MERELY MEANS THERE'S A DEARTH,
   AND ELECTRON FLOW IS OPPOSITE - WITH THIS WE HAVE TO LIVE.
   SO WHEN YOU PRESS YOUR BUTTON OR RATTLE ON YOUR KEY,
   AND ENERGISE YOUR MASSIVE QUAD OR LONG WIRE TO A TREE -
   THE MOVEMENT OF ELECTRONS PAST ANY GIVEN SPOT,
   IS WHAT GIVES YOU YOUR POWER - BUT YOU NEED NOT FEEL A CLOT
   IF YOU THINK THE CURRENT'S FLOWING DOWN FROM POSITIVE TO GROUND,
   OR ELECTRONS GO OFF SIDEWAYS AND THEN SPIN ROUND AND ROUND -
   SO LONG AS YOU CAN TUNE YOUR RIG FOR SIGNALS PURE AND TRUE,
   AND SOMEONE GIVES AN ANSWER EVERY TIME YOU CALL CQ.
       73 DE KEN ZL1ACS

BAYCOM MODEMS - A WARNING
------------------------- from ZL1DDL

It has come to our attention that some people have been designing
modems for use with the BayCom software which use an MAX232 level
converter instead of the 74HC04 or 74HC14 inverter chips.

One of these designs appeared in a recent article in 'Amateur Radio'
and, as far as we understand, also in another VK magazine.

The BayCom team in Germany conducted experiments on prototype modems
with a MAX232 a long time ago, finding that such modems would not run
on about 20 % of all machines that a standard BayCom modem would run
on. The reason for this is that in a worst case situation, the current
drawn from the RS232 interface by the MAX232 designs can be as much as
200% and more than the current consumption of the standard design.

Even in a best case situation, the MAX232 circuits will draw
significantly more current than the standard modem circuit.

Therefore, the MAX232 design was abandoned in favour of the HCMOS
chips. The name of the game was to construct a circuit which would
work on the highest possible number of IBM compatible computers.
No problems have been reported so far with the transistor circuit
used to transform the incoming data for RS232 use.

We therefore recommend that homebrewers should not use MAX232 chips
in their modems. Users who found that the MAX232 variety does not work
for them should consider using an external power supply for the modem
to overcome this problem.

73, Ulrich ZL1DDL
(approved by Johannes Kneip DG3RBU)

COMING UP NEXT WEEK : Part 2 of the series on packet throughput, a
story on interfacing by Henry ZL1AAN, News from the regions, TPK and
some hints and kinks on it's use.

Thanks to the contributors this week: ZL1DDL,ZL1AQ,ZL1ACS and ZL3CS.
That concludes this edition. Items of general interest to data mode
users are solicited for future newsletters. Your contribution may be
sent via post, RTTY or packet to Alan ZL1-AMW. This broadcast is
normally sent at 0930 and 1900 hrs each Sunday on 3545 kHz , first
in 75 B Baudot then repeated in Amtor Mode B (FEC).

          73 to all from your temporary editor Doug ZL1AVY
              107a New Windsor Rd. Avondale, Auckland.

I used to have the same problem until I found that TNCTSR-S was not correctly
configured...when using the setup program TAILOR22 be certain to specify
TNCTSR-S or -L, whichever you are using and be certain the addresses are
correct...Once I did this, there were no problems...

Many thanks to those who replied to my query on use of my new DRSI interface
under NOS. For those who might be interested, here are the correct entries
to be included in my autoexec.nos file:

        attach scc 1 init 0x300 0 2 0 1 0 7 p4915200 8
        attach scc 0 ax25 dr0 236 d1200 1024 n3bda-10
        attach scc 1 ax25 dr1 236 d9600 1024 n3bda-12

I was close, but I messed up some of my parameters. Special thanks to John
Spitznagel, KD4IZ who supplied me with the right parameters. I am now working
fine. The NOS manual mentions an "attach drsi" command which is supposed
to set up a DRSI board. My software choked on this, but as Dennis
Jacobson, N6NG pointed out, my copy probably doesn't have the DRSI code
compiled in. Many of these features are left out by default to make a smaller
executable.

Again TNX to all ... de N3BDA

 I don't actually know how many FBBS users we have here on USENET/Internet,
but one possible suggestion would be to start a mailling list to handle
such discussions. I would certainly be in support of this idea, but don't
believe FBBS discussions warrent a newsgroup.

Actually we have started a F6FBB mailing list on my site, an
announcement should follow tommorrow, but basically if anyone is
interested in subscribing they should send email to:

listserv@stat.com

First line of text should be:

sub f6fbb-list

I reckon 4X1RU has a copy of it :-)

Perhaps the answer is for all sysops to put 4X1RU in their reject files?

I got my copy of the release version of X1J yesterday, and it is now
available for ftp from ftp.demon.co.uk (/pub/ham/x1j.exe). If anyone
wants to put copies on other sites then please do so!

Lines: 20

Hi there, I'm an expat from the US living near The Hague, NL. During
the long winter evenings I'd like to set up a 2m NOS station. I was
wondering if there is any such activity already going on nearby, or if
anyone would be interested in starting.

If I get ambitious with antennas and amps, I occaisionally might get as
far as the eastern UK, since I live quite close to the shore. Also I
hope to upgrade to a class which would allow HF (I'm operating with
reciprocal priviledges now).

Hope to hear from someone!

PacketTracker is a program which accepts MONITOR data from a TNC and
displays a visual (graphical) map of the communications that it sees in
level 2. It does not interpret network stuff or understand about TheNET
or ROSE. It IS VERY pretty though.   RATS is distributing it here in
NJ. I don't have the RATS address handy. It's freeware tho.

I'm looking for technical info on the new Sony GPS unit. It accepts
memory cards and mentions Jeppheson (?) format. I want to know if it
can be programmed by normal users or some special development kit is
required.
Any info will be helpful since I can't seem to get past the Sony
sales department. Maybe some aviation types out there can explain
the Jeppheson format and how it can be used.
Thanks in advance,
Greg McGill

A few people have asked where they can get TheNet X1J on the internet.
It is at UCSD.EDU under: hamradio\packet\tcpip\incoming file name:
x1j.exe

I have DELETED the beta version that I placed on there before the
official release.

Perhaps I'm prejudiced by my somewhat limited contact with Internet;
but for me at least, it would take considerably LESS time to have
worked out the connections myself than to post an inquiry and wait
for a response. You still have to wire the blessed thing anyway, and
you'll probably have to check it with a meter once you've wired it -
so the difference is inconsequential.

I, too, have been fiddling with NOS - but that's not really "radio",
is it ? Making 1200 baud packet into a bad imitation of Internet is
not what I would choose as a preferred form of recreation.

I'm reminded of a story that happened to me at work one time: one of the
MIS department people was "helping" install something-or-other on a
personal computer. When asked (not by me) to look at some hardware-
related problem, he replied "No, I'm not into hardware". We warned
him that someone of his specialized skills was obviously not going to
stay long employed by our company; and sure enough, he was terminated
a couple of months later.   Computer people, and hams, had darn
well better have a good understanding of the hardware or else will
get into deep trouble.

Can a 9600 baud packet station be set up entirely out of commercially available
items (not kits)?
This would have to include a TNC, a 9600 baud modem and a VHF or UHF radio.

How about higher baud rates? 38.4K would be nice. At these higher rates, it
becomes more
resonable to transfer picture and sound files.

Hi All!

I'm looking for a CW filter for a Kenwood TS-120S. I think the part number
is YK-88C (not positive of that).

I'm not sure if they're made any longer or not, but if someone knows where I
can pick one up, I'd be appreciative for the info!

thanks ahead!

I understand that there is a mode out to allow high end VHF haigh band Motorola
Micor radios to operate in the 222-225 radio. We are setting up a local
interconnecting backbone and wish to put it on 220, but wish to keep it
commerical gear.

Does anyone out there have such a creature?

Is there any Unix software out there for modem-only TNC's like
Baycom? Or will I have to break down and use MS-DOS?

Don't know about the address above, but X1J <IS> on UCSD.EDU under the
tcpip directory area.

There are lots of ethernet cards which are supported by the Crynwr (aka
Clarkson) packet drivers. They're in the public domain and can be found on
many FTP archive sites.

Hello,

I was wondering if there's anybody here who'd like to explain

me some basics on packet radio (a FAQ perhaps) ?

Mailing is probably the way to go or y'all will be fed up with
me very soon :).

Mind you, I don't know ANYTHING yet, but I'm interested and I wanna
be 'packeting'/'HAMming' whatever it's called, as soon as possible..

Please? Zerial..

A newspaper item from the Saturday Lexington-Herald Leader Lexington, Ky 9/11/93
states that the MicroSoft Corp. said yesterday that it will begin charging
customers who call for help with its WINDOWS operating system. Individuals
may be charged $2 a minute, to a maximum of $25 a call, and companies thousands
of dollars annually under a pricing structure that takes effect Oct 1.

(Followups to the OS advocacy groups, where this really belongs; it's only marginally packet-related.)

Get OS/2. IBM charges nothing for tech support...this is part of knowing how to support customers. Not only that, but chances are you won't need to call, either, as OS/2 is quite a bit more stable.

I have a used MFJ TNC-2 with a KISS-capable eprom inside.
KISS ON flips the KISS flag but the unit continues to operate
in AX25 (cmd:) mode. Following this with RESET resets the TNC,
along with the KISS flag. Far as I know, all necessary mods
have been made for proper operation with the current eprom.

Is there a way to put this MFJ TNC-2 into KISS mode?
This is how the power-on banner reads:

    MFJ ENTERPRISES INC TNC-2
    AX.25 Level 2 Version 2.0 + FAX
    Release 1.2.6 02/17/89 - 32K RAM
    Checksum $1C

Thanks,
Dave

Hey Jay -
  You know, I passed up an opportunity to get a free copy of OS2 at ONEBBSCON. All I can say was "I was suffering from the altitude" :-). They were handing them out to SYSOPS, to get them to try to run their BBS software under OS2. Win some loose some :-).

I put it on ftp.demon.co.uk on Friday evening (see my other post in this group on the subject........)

The reason it has been hard to find is that it has only been out for a week now. Make sure you got the full release version and not the beta-test which leaked out a couple of weeks ago.

I have been out of amateur radio for about a year now. Its been a while
since I have been on packet, and I have an itch for it again.

I would like to get into running tcp/ip on packet.

I beleive I have a coordinated tcp/ip address, but do not know what it
is at this point.

As well, I would like to run this on my Sun MicroSystems IPC. I was told
that I could use a drive to allow me to use the built in Sun tcp/ip

stuff for packet.

Does anyone know how I can get this driver?
Is it a loadable module?
Will it work under Solaris 2.x?

thank you in advance to all netters,
stuart

The readme file was NOT of the readme.1st variety warend about in the
earlier bulletin. It also stated that it was the release version.

Any chance of scanning them and making them available on ucsd.edu?? Without
seeing them, I don't know if I could translate them. I also don't know how
much time it woiuld take, but if enough people read them, I'm sure a translation
could come out of it. And anyway, I can probably read enough of it to decide
if I can use the information.

  I recently received a request from the VP of the local packet users group that I would like some help with. Essentially (see attached note) the person is looking for some software to diagram the local packet network based on the node interconnects. It sounds like he would like the diagram to be drawn by the s/w after the connection table is entered by a user.

  Anyone have any leads on a program to do this? Thanks in advance.

Tom, the MFJ works great for the price. It will allow you to do tcp/ip because of its KISS mode, and its modem disconnect header is an easy way to hook up an external modem for higher speed packet when the time occurs. The good thing about buying a "true" tnc is that it will work with any comm program, whereas the PMP and BayPac need some sort or proprietary software to run with em. Yeah they have tcp/ip and all those emulators, but just use nos for the mac or nos for the amiga or nos for the coco or for the pc, whatever you have the tnc will do it! Like i said, its a fair price for either, the 1274 has the tuning for HF and the 1270 doesnt, so if you want HF get the 1274, if not just get the 1270! Good luck with your purchase!

Alan, i think you have the 1274 mixed up with another tnc from MFJ.
Isnt the 1274 the same as the 1270 except it gives you the HF tuning
indicator?

  What version of SoftKiss are you using? I have had reports that SoftKiss
can get into a locked transmit state. Try disconnecting your PMM, turning
off SoftKiss, and then trying your IM/Mac transfer. Obviously it won't get
to your radio, but see if it locks up in the same way.

  (BTW: I'm not the author of SoftKiss. Aaron Wohl is. I am the author
of Savant, which also works with SoftKiss.)

I agree. If I could take a look at them, I might be able to decide if
I know the english equivalent of the German technical terms to make
something of that. I speak German my native language and am quite
fluent in the English language.

So if I could take a look at at least part of the original, I can
decide if I might be helpful.

I'm not familiar with PC Plus; you should check to see what
kind of terminal it emulates and how accurate it does so.
Is it some sort of ANSI 3.64 type of emulation? That might
be a problem if your TNC actually sends thru compressed binary
data that contains certain magic character sequences. For example,
what does your terminal emulator do when it receives an ENQ
character (0x05)? Does it send an Answerback sequence? Also,
what about ESC Z, or ESC [c, or ESC [0, or ESC [> c, etc.
There are a whole bunch of sequences that could cause an
ANSI 3.64 compatible, or VT100, or other type of terminal
to autonomously transmit or to lockup in a funny mode. But off
the top of my head, I can't think of one that would just cause "]"'s.

Please move all discussion from rec.radio.amateur.packet to
rec.radio.amateur.digital.misc. There are 3 weeks left before this group
gets deleted. It is being replaced by rec.radio.amateur.digital.misc to
include a wider range of digital radio topics.

There's an easy way to do this. Everyone can continue the discussions that
are in progress. Just add a header line that says:
   Followup-To: rec.radio.amateur.digital.misc
like this article does. Remember to watch for the replies in
rec.radio.amateur.digital.misc.

I am trying to run MSYS with a single TheNet 2.08B-equipped MFJ 1274.
The idea is run MSYSB for the BBS and let the Netnode function be
done by TheNet. The node TNC works fine alone. I have wired the
cable and made the MSYS.OPT change per the docs, but nothing seems
to happen when I bring up MSYS or MSYSB. Any ideas? 73, John

Anyone need a computer for Packet? I have two Heath H-89, and one H-8
computersthat I need to get out of my house, wife says OUT! These computers run a
system from a floppy disk. They are NOT compatible with anything else in the
world. If you have some programing experience, or want to get some, this systemis
for you. I have a DOS system and also CPM. I have Basic, Cobol, and
Assembly language assemblers. The H-89's are Z80 based, the H-8 is 8080.
These systems are ideal for a Packet/logging system for someone who wants to
play with software. I have pounds of documentation that will go with the
systems, along with all kinds of software and utilities. The H-89's are
terminals with the CPU built-in. The H-8 is a standalone CPU with expandable
card cage. These systems provided a real learning experience for me, they
are not for everyone, they are not turn-key, but I will let these go CHEAP.
If you got the time, I got the Packet Computer for you. First person gets
a shot at the best software choices.

Last year a friendly local sysadmin connected my home computer to the
Usenet. (This post comes from an AT clone via UUPC--a DOS pun of
UUCP.) The textbook _Managing UUCP and Usenet_ by O'Reilly and Todino
was very helpful to me in grasping the technology.

Is there a comparable textbook about digital radio?

Dale Wharton   <dale@dale.cam.org>   M O N T R E A L   Te souviens-tu?

[Grrr ... how nice of our news software to dispose of the body
of my last message ... so I try again.]

Does anyone know if there is any software available for the
Amiga (under AmigaDOS not Unix) which will allow me to set
up a full featured BBS and e-mail system with TCP/IP support?

Currently I am running AmigaNOS, which is good as an e-mail
system, but which totally lacks support for news & BBS style
functionality. [It's also buggy and doesn't really deal with
the Amiga OS very well, but that's another issue.]

What I am looking for would ideally:

* Provide full support for TCP/IP and NET/ROM,
  including things like SMTP and FTP and TELNET functions
  (as AmigaNOS now provides)

* Support a mail system. Messages, forwarding, replies,
  etc. AmigaNOS provides some of this, although it could be
  improved upon.

* Support a news system, with different message areas et al
  such as we are used to on Usenet netnews.

* Have a decent interface to the news system, with the usual
  facilities we usually expect in our favorite news readers,
  such as subject search mode, filtering out unwanted things
  (kill files), followups, e-mail replies, etc.

Any suggestions?

I've crossposted this to rec.radio.amateur.digital.misc and

rec.radio.amateur.packet. Followups should probably be directed
to rec.radio.amateur.digital.misc only. Or email to the
address given below. I will summarize my findings if there is
sufficient interest.

Thanks & 73,
     --Mark

I used to own a W2A and used it successfully on Packet. I called ICOM and they
faxed me the schematic for constructing a connector to the W2A for packet. I
dont have the fax anymore (gave it to the purchaser of the W2A) but you can
call ICOM Tech Support and they will fax it to you.

btw, the cable I made was for the KPC-3 and I have no idea if the connector on
your TNC is the same, but I will sell you my cable for what it cost me to make
it & ship it, say $10. It has the W2A size plug on one end and a metal DB9
connector on the other end. Inside the DB9 is the resistor and capacitor
you need for the PTT wire like the FAX illustrated.

73 Bob

I believe there is a piece of software named Packet Tracker (?spelling) for the Macintosh that will automatically generate the links in a packet network. Not sure if it is avaible from ftp. I am pretty sure I have seen it advertised in the magazines lately.

   I guess I should have been a little more specific. It needs to run
on an IBM compatible. DOS, Wind*ws or OS/2 are all available for use
on the machine(s) this person can access.

   Any leads using this additional information are appreciated.

   Thanks in advance.

netwalker which is included in the w0rli package will do this. It provides raw data and has to have human intervention to make a reasonable map out of the results.

22 August 1993

This is a weekly unofficial bulletin of news and views from ZL amateurs. It does not represent any official viewpoint, and all opinions are those of the contributor.

Christchurch Jottings.
---------- By ZL3CS.

Recently, I was pleased to receive a used 'A.E.A. Micropatch.' Sadly, it had no owner's manual or interconnecting leads. This unit is capable of decoding RTTY, AMTOR, ASCII and CW with the help of the C64 computer. Inquires in several directions for a manual came to naught. Decoding CW manually and by computer, has always interested me and I decided to 'have a go' without the appendages.

Plugs for the user port of the C64 are as scarce as hens teeth as are the 5 pin varieties for the micropatch. Luckily, I had salted away in the junk-box, my old 'Galbraith' 6802 computer upon which many hundreds of hours had been spent building and making it operable in the early 80's. The main bus system used several edge connectors which are of the same pitch as that required for the C64 user port but are far too long. A couple of hacksaw cuts, some filing, together with some epoxy glue, soon fashioned a suitable plug, and happily, an old 10 pin plug from the IBM clone, filed down to 5, fitted the micropatch.

All that had to be done now was to figure out the correct terminations. This wasn't difficult, as back in the late '80's I had used the same "MBA-TOR" programme as is used in the micropatch eproms, but not on CW, as at that stage, I had no suitable CW demodulator.

Has the effort been worthwhile? I am inclined to to think that it was. Of all the various methods I have tried, none read CW like this system. Static crashes and odd noises from electric fencers etc., were no impediment to great copy of good morse. QRM is another matter. Modern transceivers can separate most of it but, don't expect intelligible copy of a CW 'pile-up'.

One of the main problems now is to find suitable morse. Useful copy can be made of CW which has adequate spacing, which unfortunately, seems to be one of the missing attributes in a majority of local signals. No operator enjoys hearing that his CW is difficult to copy because of sending deficiencies, be it mal-formed characters, or anything else. Isn't it a pity that more use is not made of the 'R' content of 'RST'? All signals are not 'readability 5'. It is common for a weak, QRM and QRN covered CW station to be reported as something less than R 5, and no offense to that is taken or implied. A strength 9 signal is not always 'R 5', but, very seldom is it reported 100 per cent honestly, to be 'difficult' copy by virtue of the senders style of signalling.

I have digressed somewhat. Now, back to the Micropatch. This unit can be used to decode data with software other than MBA-TOR. Just unplug the unit from the expansion port. The eproms are now power- less. Re-arrange the wiring to the 'user' port to suit the new soft- ware and load the C64.

I am in the process of 'manufacturing' a new plug to fit the 'cassette' port which is used in conjunction with the 'QBF' software. A small interface will also be required to change the

press-to-talk polarity, and to restrict the voltage to compatible

TTL levels. The QBF program is, in my opinion, more ''user friendly'' than some of the others. It automatically selects the correct receiving software for 'ARQ' or 'FEC' ATOR modes,and allows the operator toarry out hher keyboard tasks whileis, in my opinion, more ''user
friendly'' permits the insertion of the
other station call-sign and operators name if required, into prepared texts.
I hope to report on the success, or otherwise, of this project, in a future 'jotting'.
73 de Guthrie.

NOAA 13 Weather Satellite
---------- from ZL1ACS

NOAA 13 is the polar orbiting satellite replacement for NOAA 9 which had been in operation for many years. Whatever happened to NOAA 11?) Its path over NZ is in the wee hours of the morning and mid afternoon. But are the keplerian elements a little elusive in its early days? Reports on packet would seem to confirm this. No doubt the weather office in Wellington would oblige. However, why not try a do-it-yourself frequency? The Australian axm transmissions on 11.030 KHz and 13.920 KHz break their wx fax transmissions and transmit the NOAA apt predict (tbus) bulletin at 1215 hours NZST daily in RTTY. The RTTY is at 50 baud and is wide shift.

The transmission usually is comprised of both the current NOAA satellites information. Part iv of each containing the necessary keplerian element sets. Interesting notations often appear in the remarks following part iv. The transmissions have occasionally included the Russian meteor weather satellites.

73 De ken ZL1ACS

PACTOR and Packet Frequencies
---------- from ZL2UT

In an effort to separate PACTOR from packet frequencies on 40 meters te PACTOR users have come up with the suggestion that they

move up to 7040.5 KHz for a trial. There are several NZ and Australian stations with BBS capability who propose to run 24 hours.
  At present PACTOR users do not have a 'home' and originally started on 7035. There is an Aussie station running 24 hrs on 7035.45. He along with us will move, so as to leave that freq free for TCP users.
  Please feel free to comment, contact ZL2UT at ZL2BQK.

  Overseas, there are seversal German and Spanish stations using the freq of 7034,7036,7038,7041, ... and Americans up on 7071 thru to 7081.5...Nothing we can do here?
  Regards de Basil ZL2UT

Boxholders On The SELCAL
------------------------ from ZL1AVY
  The creation of a 'box' on the SELCAL is not automatic. RTTY users who want to receive replies to messages sent , should send a message to the Sysop (Alan) requesting that he opens a 'box' for them ie:
  ZL1AMW ZL1AMW ZL1AMW de ZL1AVY ZL1AVY ZL1AVY STORE STORE ZL1AMW ZL1AMW (4 n's).
  When the system replies requesting your input , send:
Hi Alan - name here is Doug and QTH Auckland City Aucland City. Would you kindly open a mailbox for me?. Thanks and 73 de Doug (4 n's)
  The above is an example - you will of course send your own callsign and name and QTH.
  When Alan reads that message he will 'open' a file under your call and will register your name. Until he does this , messages to you from your friends, will not be accepted reliably on the SELCAL.
  73 De doug

 That concludes the Data News for this week, this sheet is Prepared at the shack of ZL1AMW from contributions sent by post, RTTY and packet. Text is also obtained from packet BBS stations,
and Selcals on 7045/3545khz.
 This news is transmitted weekly on Sunday mornings at 0930hrs (local) and repeated at 1900hrs. Both transmissions are on 3545khz. It is first sent in Baudot at 75 baud, then repeated in AMTOR mode B (FEC) on both occasions.
 73 to all from Alan, ZL1AMW, 20 Lorne St., Hamilton.

Computing 93 Expo

----------------- from ZL1ACS

Yes! It is that time again! September 2nd, 3rd and 4th at the Auckland expo centre, Greenlane Showgrounds.

Time to get a look and try a hands on experience with the latest in the computing scene. You might even be the winner of a notebook PC, time on the big BBS or other software package prize.

And yes! Entry is free - providing you attend on the Thursday or Friday!

73 De Ken ZL1ACS

Packet Forwarding

----------------- from ZL1AMW

For all of the past week, the Klondyke (Auckland) 900 repeater has been off-air, with the result than no forwarding has passed from the northern areas of the North Island. At the time of writing the repeater is on-air again (Sat), so it is anticipated that there will be a flurry of forwarding appear Sunday morning.

As a result of this, last week's newsletter would be delayed to many locations, and this week's may get buried in the many needing update now the traffic is on again.

I have not heard why the repeater was off, but once again we must thank those who put their time into keeping our fixed stations on-air.

Waikato News

------------ from ZL1AMW

The OTO digipeater has been off-air due to an equipment failure for a week also, and was restored on Thursday. It is fortunate this event coincided with the forwarding failure, as those who need the digipeater to access their local BBS would have missed little in that period. We must continue to co-ordinate our failures in this way for the future... hi.

Twelve Little Volts

------------------ from ZL1ACS

(This ditty is dedicated to all newcomers who find it difficult
to visualize the voltage drop along a conductor)

Twelve happy little volts, rushing down the line-
crashed into some travelling holes, then there were nine.
Nine busy little volts, running rather late-
took the wrong short circuit path, then there were eight.
Eight worried little volts, feeling rather sore-
met a pack of savage ohms, then there were four.
Four weary little volts, getting rather blue-
tried to jump a valence gap, then there were two.
Two dead beat little volts, strength was almost done-
tried to light a six volt lamp, them there were none.

73 De Ken ZL1ACS

Hello,

Is it possible to use an Amiga with the Baycom compatible modem ?
Which programs includes the drivers to run the Baycom Modem (for the Amiga) ?
Is it possible to run AmigaNOS with a Baycom Modem ?
Is it possible to find programs like F6FBB on the Amiga side ?

Thanks a lot and best regards.

Pascal.

Hi!

Just some thoughts on an inexpensive starter system - but be warned,
you're going to want more soon!

For an inexpensive start I'd look in rec.radio.swap for some used
equipment. An Alinco DR-110 2m mobile rig runs about 35w and makes
a fine packet rig. For a TNC you could consider the Baypac from
TigerTronics. They advertise in QST and CQ. It is actually a modem
that connects to the serial port of a PC and the TNC is implemented
in software. I think his goes for about $50, new. For an antenna,
you could possibly get by with the MFJ 1/4 wave ground plane for
just a few bucks.

I think this is a minimal system that may get you by for the time being.

Hello everyone,
    I have bought a BAYPAC BP-1 modem from Tigertronics and am having problems connecting with it. I was wondering if anyone else out there has had the same problem. I am using Baycom 1.4 software, a Radio Shack HTX-202 radio, a MFJ rollup J antenna, and a IBM PS/2 30-286 computer. I have since talked to Tigertronics about the problem and then I sent the modem back to them and they sent me a new one. The problem is still there. They said that the wiring was okay, so I know it is not that. What happens is that when I enter C WB3JOE at the command prompt, it brings up the message CONNECTED to WB3JOE, but that's it. Nothing else comes up until the disconnect message does. Can anyone help me out. Please let me know. Thanks.

Greetings. I have been monitoring this forum for a couple weeks now
trying to get some ideas on how to establish a wireless digital link
between two computers at 9600 bps or greater. One computer is a mobile
robot controller with an async RS-232 port, the other a PC, also with an
async RS-232 port. A range of 250+ feet, through walls, furniture,
people, etc., is needed.

Packet radio type technology looks sort of like what I need (I have read
the FAQ). But, the equipment needs to be small, and low powered (in both
manners, x-mit and power consumed).

Am I looking in the right place? Does anyone have any ideas, thoughts,
etc., regarding this subject? I'm not a HAM, however I do have a basic
knowledge of RF, receivers, x-mitters, etc. (my Dad was a HAM - worked
for VOA for 36 years).

Thanx!

Steve Engle

Keywords: BBS F6FBB FBB SYSOP

I put this out on packet and have received several replies from others
who see the need for it too.

I recently ran out of patience waiting for Roy (AA4RE) to catch up with
the other BBS software authors and made the change to FBB. He has been
promising compressed forwarding for years but each new version comes
out without it. I still believe BB is one of the best boards written
and stuck with it for MANY years.

As a new FBB sysop (about a month, maybe more), I find the
documentation to be a little slim for the first timer. My neighbors
who use it feel the same way. We each have several questions that
don't seem to get answered when we read the doc hour after hour.

Is there enough interest in this to form a mini-group within rrap to
share findings and experiences? Are there any REAL experts that can
answer the tough questions that we come up with that no one else has
found the answers for yet?

I'm interested, to say the least. Anyone got any ideas how to get this
going?

I have questions that I have put out to the packet community and not
received real answers for, and have received lists of questions from
others. I'll present them here, in case this posting can become the
beginning of such a group discussion.

Questions that come to mind immediately:

How can we make FBB allow SP FBB@ALLUS to remain P instead of B type?
   (the way it should be)
How to fix the (C)ontinue no paging command so it will work right?
Why does the M_FILTER in AYI_FILTER not work reliably? Sometimes it
   works, sometimes not.

Questions received from others:

How to broadcast mail beacons on all channels of DRSI cards with BPQ
   switch?
How to add bulletins at sign-on for all users when needed (I use
   english.ent, anyone have other ideas what he wants?)
How to send P-mail to all registered users to make sure they see
   announcements?

How's the interest along these lines? Let's get something going. This
is quite a program. It just needs some TLC, I think.

Summary: Have X1j release version, glad to share
Keywords: TheNet X1J Network Node

I acquired X1J release version yesterday and have already burned two
chips and installed it. All seems to work fine. I had quite a bit of
trouble finding it and finally got it from someone else. I was told
that it was on UCSD but was unable to find it there either.

If anyone is still looking for X1j, feel free to contact me. It is in
two files, X1J_PT1.ZIP 200k, and X1J_PT2.ZIP 100k. The first part is
all you need unless you are going to use/build the deviation meter
function into your node. Part 2 includes the deviation meter.

I have 14.4 modem and can do direct transfers to anyone needing it. I
would also be glad to upload it to an ftp site if I knew of the right
one for everyone to have good access. I have to kermit at <100 cps to
get the file from me to my server, so am not anxious to do it more

than once.

Drop me email direct if you want to call and download via modem.

I hope everyone else has had better luck finding J than I did. I had
to dig. That's why I'm offering it here.

 Hello

Is it possible to use a Baycom compatible modem with the Amiga Computer ?
Is it possible to use a BBS sytems developped for the Baycom modem on an
Amiga ?
Is it possible to run NOS like program and a Baycom modem on Amiga ?
where can I get the drivers to drive a Baycom modem on an Amiga ?

Thanks a lot.

Pascal.

Baycom only works with IBM compatibles at the moment.

Steve

At a hamfest last month, I bought a Kenwood TR7400A, without a manual. I
want to connect it to my MFJ 1270 TNC for permanent packet use. Can anyone
tell me how to wire it to the TNC and/or where I can get a manual for the
radio?

For connection of a MFJ TNC (1270, 1270B, 1274, 1278) to a Kenwood
7400.
5 pin DIN PLUG   4 PIN MIC PLUG
1 - Mic Audio ------------------------------- 1   Mic Audio
2 - Ground----------------------------------- 3&4 Ground
3 - PTT-------------------------------------- 2   PTT
4 - Receive Audio---------------------------- to radio ext spkr
5 - Squelch Input-----No Connection

Hope this helps, de N0MGJ

If there is enough interest I'll start a list-serv forum....???
I connect once a month to England and download the latest/greates in
utilities etc. I just did it again today, 9-5-93...lots of new stuff!
And, got to use the new BETA version which has YMODEM!

It takes so much work to get FBB running right, I'm not sure I would
jump back that fast. Too much time invested!

BEAT version of what?? that has YMODEM!

Sorry, I'm new enough that I don't know what a list-serv forum is! I
got a reply from KB2EAR (kb2ear@kb2ear.ampr.org) saying he "would be
willing to set up a mailing list" on one of his computers and what did
I think? Again, I don't know what that involves or accomplishes. Sorry
I'm such a novice at this medium.

Absolutely!

I'm running JNOS on my dual port DRSI card at the moment.

Steve, this subject comes up frequently. There are several options.
You can use packet radio with commercial frequency radios, or 49 MHz
Part 15 radios, and ordinary amateur TNCs. The Pac-Comm Micropower
model would be a good choice. However, if you want true 9600+ baud
throughput, a 9600 baud packet system won't deliver it. Due to the
overhead, turnaround delays, retries, etc, your actual throughput
may be no more than what you would expect from a 2400 baud phone
modem. Of course the result will be error free, which is worth
something in a mobile RF environment.

Another choice you could make would be one of the wireless LAN
products such as the NCR Wavelan product. It's range is modest,
and it's cost is high, but it will deliver an effective throughput
of 9600+. The drawback here is that you need a PC slot at each
end, and it's not exactly low power.

There is a third, and cheaper, alternative that most people seem
to overlook. Simply use a cordless phone and an ordinary phone
modem. You will need error detecting methods to deal with fades

and noise (MNP or Xmodem type software), but it's standard off
the shelf technology. The only hardware hacking you have to do
is to tap into the cordless handset for the modem connection.
A 2 wire to 4 wire converter is required. You simply force the
modem into local online mode with the ATA command and you're
in business.

Gary

30 years age (when I was 14) this would have been a useful and
interesting process. Now it is just an unnecessary task. If the info
is already published and available, get it and move on to other things.

>they bought at Burghardt's. Is there no experimentation in
>ham radio any more ? Goodness knows running 1200 baud AX.25 is

Why, does your definition of experimentation only include playing
with hardware? My experimentation consists of installing, configuring
and eventually modifying several versions of KA9Q's NOS programs. As a
programmer, specializing in digital communications, I get much more

enjoyment from fiddling with the software than I do with the hardware.

Since my tech license is only a year old, I am still just getting my feet wet in this hobby, but it has already given me more enjoyment than anything else I have done in the last 25 years (since high school). My hope is that from my "experiments" with NOS, I can create something to give back to those who have helped me.

While I understand your reaction, I think you may be focusing on the hardware side of our hobby, and losing the big picture. There are many facets to amateur radio (and life), and different people find their niche in different facets. If this were not so, life would be very boring. Learn to see and enjoy this diversity. It makes for a richer experience both in this hobby and in the rest of your life.

Does anybody wrote a driver for a BayCom-like MODEM, that's operate
under the MS-windows operation system?
Who is interested in developing/porting a driver?

I'm always mystified by requests and answers like these.   Are TNCs
generally so difficult to connect that the first impulse is to
ask for help ?   It so happens I have a TR7400A, also a TAPR TNC 2 -
admittedly, I did have a much photocopied, reduced, fuzzy schematic of
the radio, showing the mike connector (and subsequent owner's
modifications of said connector) - but really, how long would it
take to ring out the PTT and mike lines with a meter and dope out
a suitable interconnect ?   I've also seen some descriptions of
connections to hand-helds - sometimes the owner's manuals apparently
mislead with the value of the keying resistance, but an evening's
experiment with a pot would provide the answer.
   In Canada it's called the "Amateur Experimental Service" - but
it seems everyone in this part of the world just unpacks boxes
they bought at Burghardt's.   Is there no experimentation in
ham radio any more ?   Goodness knows running 1200 baud AX.25 is
nearly as moss-encrusted a tradition as Morse.
    Bill

Wanted: GE Exec II mods for 9600 baud Packet

I'm planning to use a 450 Mhz GE ExecII on 9600 baud packet with the
latest PacComm TNC. If anyone can pass along information on the mods
required and/or the interface used I'd appreciate it. I can be reached
at gdo@aloft.att.com and if possible, please also reply to my partner
in crime, John Bednar WB3ESS, who is at wb3ess@aloft.att.com.

I just got a DRSI PCPA Type 1 interface for my PC. For those unfamiliar

with the PCPA cards, they are dual-port packet interfaces built on a PC card.
The Type 1 has a full-blown 1200 baud modem on one port and a serial interface
on the other. I'll be attaching a 9600 bps modem on this port soon.

Anyhow, the software that comes with the card works fine, allowing the card
to function as a nice AX.25 TNC. I wish to use it on my TCP/IP node which
is running the PA0GRI version of NOS. The documentation claims there is
a "attach drsi" type command, but the software says there is no such animal.
Upon further investigation, it looks like the "attach scc" command is what
I should use. Given the syntax of the command, I set up the following lines
in my autoexec.nos file:

```
attach scc 1 init 0x300 8 2 0 1 0xff 7 p4915200 8
attach scc 0 ax25 dr0 512 1200 1024 n3bda-10
attach scc 1 ax25 dr1 512 9600 1024 n3bda-12
```

NOS seems to like this, but when I go to connect, my XMTR output is an
ear-piercing continuous tone instead of the familiar buzz of data.

The base address is indeed 0x300 and the IRQ is indeed 7 with no conflicts.
The clock speed spec was vague in the NOS manual, but the PCPA manual
states the SCC clock rate at 4.9152 MHz. Nos wants it specified in Hz.

What am I doing wrong?

I've tried to get NOS working with the BayCom modem with no luck
don't know if it's just the way I'm setting it up or what.

But if there is someone out there that has some good luck with it
and has it up and running could you PLEASE send me a copy of you
AUTOEXEC.NOS and let me know what NOS are you running. I'ld like
to give it one more go at it.

Thanks in advance,

Do you change electrical outlets when you move the terminal?

It's most likely that the stray RF is getting in by way of the
power wiring. If running your terminal from a different outlet
helps, do it. You can also try winding the power cord around
a ferrite core.

Do you have a *good* RF ground at your transmatch on 20 meters?

Most "hot" chassis problems come from not having a low impedance

ground connection. Your "balanced" line shouldn't radiate, but
it may if it's unbalanced by passing too close to metallic objects.
Look at how you are routing cables in the hamshack. You should
avoid parallel runs. You may find that adding a counterpoise
wire for 20 meters will eliminate much of your problem.

Are there any mods available for the aforementioned radio for operation
at 9600 (ie. are IF bandwidth mods necessary, or just modulator/discriminator
access)?

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address, proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Internet: david@stat.com FAX: +1 (602) 451-6135
Bitnet: ATW1H@ASUACAD FidoNet=> 1:114/15
Amateur Packet ax25: wb7tpy@wb7tpy.az.usa.na

In the G8BPQ Version 4.06 e package I found the IP Router doc file and CFG file. Both are skimpy with details. I have loaded it in a DesqView window but find it opensa and immediately closes after leaving a command line at the bottom of the video page.

Does anyone out there in netland run the IP Router from G8BPQ? Are there any special things I should know? Where does the program have to come in the loading sequence? Any clues will be greatly appreciated!

I've asked about where to get TheNet version X1J, and have been told
that it is presently under beta test. I've looked for it all over the
internet with no luck.

However, I ran across an article written for packet cluster that
indicated it was available and up and running on various packet cluster
nodes.

I managed to obtain it and am now running it on two nodes with no problems
as of yet. It seems to be being passed around hand to hand and under the
table apparently, but the fact is that it is going up all over the country
beta test or not. I guess you might call that one heck of a beta test.

In any case I have placed it on ucsd.edu in hamradio\packet\tcpip\incoming
although I did not give any explanation for it. (sorry brian).

If it does not get killed .. go and get it. What's the saying? Caveat-
Emptor??? I think it applies here, although it is presently working
perfectly.

To those trying to decode the UUe file. I have compressed it with gzip,
which I thought was unix-compress compatible. Well maybe a wrong parameter
(should have reread the manual though :-( )
Sorry for the inconvenience. Bye.

I just heard about a new 'data' radio from Alinco called the DR-1200TH. It's supposed to be designed specifically for 9600 BAUD packet. Has anybody out there tried this new radio out yet? Is it just a DR-1200 with Alinco's suggested mods for 9600 BAUD?

Hi All,
Has anyone managed to connect a g3ruh 9600 baud modem to a Tiny-2 ? If so what was your experience of the work involved ? I would be glad to hear any and all comments as I intend to upgrade my Tiny-2 to 9600 baud in the very near future.
Thanks in advance,

X1J beta 1   (there have been two beta versions that I have tested)
has a problem where when it resets it may arbitrarily trash it's
NVRAM. This may do anything from take the node off the air to giving
it a callsign that is different. In between those two it
may create a node list that has all sorts of control characters
in it.

The other version of the beta test didn't boot for me at all.
I'd recommend waiting for X1J, the release or using X1H for anything
that requires ANY amount of work to change out.

Sounds like the television networks all wanting to be first with the news and none wanting to wait until they get real news.

Buck Rogers is mailing out copies of it (thenet x1j) as well via diskette and stated as much in the September 73 edition of CQ where he highlights the deviation telemetry option on the JHeard command.

I guess the "never mind if it works right, as long as it's the newest" mentality is what has kept the Kenwood TS-9xx product line profitable.

The 2Mbps differentially encoded QPSK PCM audio standard
was proved to be used only for Japanese satellite broadcasting.
A few weeks ago, one of my fellow bought a chip similar
to Toshiba's that I pointed several months ago except
not including differential decoder and serial-parallel
converter coming from NEC. This chip was proved to work
at 10.7MHz input and to work on lower bit rate.

I am going to build a quadrature modulator which consists
of a Wilkinson power devider, two balanced mixers, and
a branched hybrid all parts on a epoxy fiberglass board
on 1.2GHz band.

For measureing frequency-amplitude(power deviding ratio)
characteristics of a branched hybrid, I made it.
Since a full-size plan was drawn on 1mm square paper and
all processes were done by my hands, maximal error of
line breadth came to 0.4mm. (each length is ok.) Precise
working would requir more accurate processing. I'll try
again using resisting tape.

It is measured using an improvised 1.2GHz VFO to feed signal,
a wave-length ruler (which consists of a variable length
coaxial resonator, a Schottky diode rectifier, a variable
resister for various sensitivity, and a meter.) to check
frequency, and a micro power meter to measure outputs.
However all sizes are caluculated for 1.29GHz, fed power was
just devided 1:1 at a little above 1.3GHz and then isolation
seemd good because the wave-length ruler did not sense at
the terminated isolated port.
I am very interested in its phase accuracy and the way
to put it to properly low not using expensive equipment.

By the way, I found a quadrature modulator chip for
home-use 240MHz digital wireless telephone. This internally
has a phase splitter and mixers, and must have phase accuracy
which is low enough.

Any advice is welcome.
Thanks in advance.

Does anyone have any experiences, positive or negative, with the AOR AR-210 TNC?
I am considering using it with a 386/486 notebook computer for portable operation.
I'll probably run ka9q or other package to enable me to use tcp/ip as well as
ax.25.

I read advertisements for the DR-1200TH with great interest. I hope the
other radio manufacturers take notice. What I'd really like to see is
a 440 MHz version of the DR-1200TH, since 9600 operation is more prevalent
on that band.

About an hour or two of debugging with a scope and counter to figure
out the right clocks and jumpers. It might have been easier if I can
had read the documentation and followed it. Then again, if it didn't
work I would have spent the same amount of time debugging it.

Tadd, that may well be true. However I reset the version I have remotely both warm and cold many times and have not duplicated that bug yet. Whether it is beta 1 or beta 20 I have no idea. It is the same version written up in CQ magazine and being sent out by the author to whomever asks for it.

Let me comment please on just a few minor points. X1G was released and it had a totally screwed up node list too... it had some bugs that were serious enough to me that I pulled it off the air. X1H required a patch to fix yet another bug. If X1J has a bug that requires a fix, it would not surprise me at all.

However I am not looking for perfection at this point. I am looking to experiment and I am more than willing to live with what I find and if it is real bad.. then I'll trash it and load the tnc with something else.

If it had stayed in beta.. under control... I never would have posted it. I would have waited. However when it is being written up in CQ magazine and sent to anyone that sends a SASE mailer to the author, when it is being put up all over the place and is being treated in some cases like "I've got something neat but you can't have it", then in my humble opinion, it is time to just admit that the cat is out of the bag, warn people of the possible bugs (as you and I have done) and let the buyer beware, and the ham operator experiment.

This is not a rebuttal to anything you have said.. AT ALL! It is more just a explanation of my rationale.. which may be totally screwed up to some peoples way of thinking... in fact I am strange enough that I think that is most likely true! However, there are enough people around that I believe do think as I do (as in ... let's experiment with it and if it works GREAT, if it doesn't... OH WELL) that I put it up where people could get at it.

I am not saying that you have verbally slashed me up here.. not at all, but if anyone wants to, please put me in line to get beat up, but put me right after the author of the article in CQ magazine please... thanks!

I am about to take the plunge into packet. I've got the radio, the antenna,
a Mac (also an Amiga). Now I need a TNC. The MFJ units seem to have some
nice features, and the price is low. How do they work? Compared to BayPac,
PMP, etc. Is there something I can adapt to my Amiga? How is Savant for
the Mac? So many questions, so little time...

Thanks for any info!

Tom
KJ5LT

PS. I am most interested in VHF, but HF looks interesting as well.

The full release version is currently on Compuserve somewhere. Hopefully my
copy will appear before long (I am not on Compu$erve) so I can upload it
to the net. Anyone finding the beta-test version on the net, please delete it.
AFAIK there is no copy of the full release currently on the net.

The 1270 is a more-or-less standard clone of the TAPR TNC-2. It's fine
if all you want is a standard packet TNC.

The 1274 is a multi-mode modem. The hardware is very simple -- a rather
crude PLL type modulator/demodulator with raw serial input/output to
two of the miscellaneous control lines of the serial interface to the
host computer. ALL the decoding is done by a software program (supplied)
in the host PC. This means you MUST use a standard IBM clone.

Note that the 1274 does not use the TXD and RXD bits to send and recieve
the serial data, but uses some handshake lines (I forget which ones)
with the PC doing some kind of parallel poll to do the decoding.
This means if your PC's serial interface is in any way non-standard,
it might not work. Mine didn't. I later found out that one of the
wires on the connector was mis-wired. However, it worked fine with
my Hayes-compatible modem and my Kantronics TNC.

The 1274 has no pre-filtering of the received signal. To get decent
performance on RTTY, CW, FAX, etc. I would recommend some kind of
external filter ahead of the unit. Either selectible IF filters in
your HF transceiver or perhaps a variable-bandwidth audio filter
like the W9GR DSP unit.

   Has anyone successfully? interfaced the G8BPQ switch (pc version) and
any of the JNOS TCP/IP packages? I am putting together a full-fledged
node that is hardwired via the loopback to a JNOS 1.09 system for
TCP/IP activity rather than use the NetRom interface in JNOS over the
air. I have the G8BPQ system running correctly on the air without
JNOS and I have the JNOS system running correctly without the G8BPQ.
The problem I am running into is when I run the two if them. JNOS is

sending thru BPQ just fine. I have used the NODEDRV4.COM in BPQ and the "attach packet" in JNOS. The trouble is that JNOS is not hearing anything back thru the BPQ node after it transmits. I'm assuming that is my fault because I don't have the interupts, IOaddresses, and node port assigned correctly. I can watch the outbound packets from JNOS with a monitor program to the correct ports of the BPQ switch and I see the switch responding back thru the port. I turn on a trace in JNOS (both the node interface and the internal loopback) and see nothing. The heard listing shows nothing.

Here is what I have done so far:

```
   Parameters from the PORTS definition in BPQCFG.TXT
        PORT
                ID=145.650 NEWBB BBS LAN
                TYPE=ASYNC
                PROTOCOL=KISS
                IOADDR=2F8H
                INTLEVEL=3
                SPEED=9600
                TXDELAY=380
                CHANNEL=A
                QUALITY=100
                MAXFRAME=2
                FULLDUP=0
                RETRIES=10
                PACLEN=256
        ENDPORT
        ;
        PORT
                ID=Hard-Link to IPLQT System
                TYPE=INTERNAL
                PROTOCOL=KISS
                IOADDR=2F8H
                INTLEVEL=3
                SPEED=9600
                CHANNEL=A
                QUALITY=255
                MAXFRAME=2
                TXDELAY=380
                SLOTTIME=100
                PERSIST=64
                FRACK=7000
                FULLDUP=0
                RETRIES=10
                PACLEN=256
        ENDPORT
; there is another port (#1) that is not shown here

   Loaded in the AUTOEXEC.BAT
        BPQCODE
        YTNC 22 1 1
```

Loaded in a BAT file that starts JNOS (in DesqView)

```
     NODEDRV4 0X60 3 2
     NODEDRV4 0X61 4 3
```

in the AUTOEXEC.NOS file for JNOS

```
     attach packet 60 radio 5 256   # radio interface used directly by JNOS
     attach packet 61 node 5 236    # path to node switch (BPQ)
```

I'm thinking the problem lies in the the area of the IOADDR parameter inside the BPQCFG.TXT Right now I am using the same IOADDR and INTLEVEL that the previous port used. Somehow that doesn't seem right. There is another port on the switch to another network as well as a W0RLI BBS running in another DV window. BPQ Ports 1 and 2 are radio ports and Port 3 is the link to JNOS. JNOS also has direct access to the radio on port 2 along with the switch. (the doumentation says this can be done as long as BPQ is in control) JNOS has two ports (RADIO and NODE). NODE and BPQport3 are the loopback.

Anybody got any ideas where I have gone wrong? I'd be glad for any help or suggestions.

Seeyaalllaterbye... JoeP.

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency

coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

But this does raise a question - how do the new FCC rules apply where the originator and first relay are not under FCC jurisdiction? Do 'illegal content' messages that originate outside the U.S. get a 'free ride' through the U.S. packet system? Or(more likely) is the 'first relay' *under FCC jurisdiction* held responsible? The latter would seem to militate against PBBSs with international links relaying messages which are in a language not understood by the sysop.

Visiting my father this summer in Florida, I saw a DRSI TNC which was a board for the "IBM" (Intel) PC. I wrote the company to try to get more information about it; I am specifically interested in knowing whether or not it has a KISS mode for TCP/IP. Of course, I would also be interested in knowing what its performance is as a TNC.

Hope I can get some help/info here....

Tonight I made the cable that goes between the Kantronics
KPC-3 and the Alinco DJ-580.... I followed the Yaesu skematic,
but unfortunately when I tested it out, PTT was always on :(
According to the skematic, a 2.2k ohm resister is used... Is
that the problem? Should I use a different resister? 3.9k ohm?
Other than that the cable works... It tx's and rx's (if I remove
the Mic plug)... TKS for the help...

Hi There,
    The DRSI inboard card does NOT have KISS mode. It requires a driver that is similar to WA8DED code. The most practical use is the G8BPQ switch with supports it and also many BBS software applications. The outboard DRSI units are TNC2 clones, and of course will respond to KISS mode.

Hope this helps...

   What Dan forgot to mention, (or maybe wasn't aware of) is the DRSI board
is based off of a SCC 8530(?) I/O chip. NOS (TCP/IP) has several SCC
based drivers. One is specifically for a DRSI board (it is old and
doesn't work very well) and one is for a generic scc card and works fine
with the DRSI boards. You DON'T NEED KISS with the DRSI boards. Subscribe
to the TCP-GROUP@UCSD.EDU mailling list for more info. I don't run any
DRSI cards any more so I've forgotten the attach syntax for them. You also
need to check your version of NOS to make sure that it has the SCC driver
compiled in. Do a 'att scc' and see if it gives the needed syntax.
A info or stat should also tell you if your version has the SCC driver
in it. If you don't, you'll need to either get the source and re-compile
after you change the config.h file to give you the SCC driver or you'll
need to get someone else to compile you a version with the scc driver.
Hope that helps. The best source of info for TCP/IP would be the
TCP-GROUP@UCSD.EDU. CUL

 To turn on the "KISS MODE" in (any?) AEA tnc , I think the command
 is   ki $01

now if you are using "PC-PACKRAT" or any of the newer releases of that S/W
you may have a problem as the kiss command must be given in the dumn termanal
not the "HOST TERMANAL" and when you try to escape from the dumn term the tnc
inits again.   So you must turn off that option in the set-up screen(becarful
doing that) or use a term program (yapp, pac-term,pc-comm)that lets you exit the
program.
Good Luck with it.

I'm going to have a similiar problem, this time with Linux. It looks like
the only viable way (for my programming level) is to kludge something into
Wampes.
I was hopingh there might be a discussion group about the PackeTwins somewhere,
so I don't have to repeat something that (hopefully) someone has already done.

The firmware in the PK232 has had KISS in it for quite a long time.
Check your manual, or call AEA tech. support and give them the firmware
rev. number.

The plug-in cards are directly supported by KA9Q TCP/IP. Have a closer look
at the 'attach scc' command.

Subject: Ethernet<->Packet, is it possible??

Concerning the packet radio world I shall be considered as a newcomer.
So, I hope I will not hit a FAQ. The question follows:

Our aim is to open a segment of the ethernet to air. Since the air media
is quite the same of a wire (like it is with the ethernet) in theory
it should be possible. Ofcourse at a much much narrowed band width if
we are not speaking of 10s of GHz carriers.   We are ready to dedicate
a PC (386) on the real ethernet side that will interface the subject hardware
through its RS232 port if its not an add-on card.
 Now, is there any
hardware/software available that has the following properties:

    1) Will operate with a 144 MHz Tranceiver.
    2) SW for a IBM PC compatibles.
    3) Standard packet driver on DOS, so will be supported by many LAN
       applications.
    4) Expected to operate at 1200 Baud.
    5) Interfaced by either the system bus or the RS232 port.

Any answer, including those which say that this is known by everybody,
and direct to a FAQ list, are welcome.

sincerely

-g.ucoluk

Subject: Packet Poltergeists ?
Lines: 21

Last night I got a call from a neighboring ham to tell me my packet station was
broadcasting bunches of ascii characters for several minutes on its own, with
out having been connected to anyting. When he tried to connect, the station
only sent out "]"'s to him. I am stumped as to the cause. The only thing I can
think is that when it receives some packets that have non-text characters
(like when local nodes are processing compressed mail), the terminal emulator
on the PC starts to beep and clear the screen. Has anyone ever heard of that
sort of garbage characters actually able to *initiate* a "packet storm" like
what my station started? Needless to say, I don't leave it on unattended any
more!

BTW, my setup:

MFJ1270 TNC
Tandy laptop PC running PC Plus terminal program
Azden PC3000-2m transceiver
2m 1/4 wave dipole in the attic.

Thanks for any help!

KA9Q tcp/ip will do the job nicely. Use a variation by wg7j or pa0gri.

The cheap way to go is a DRSI Type 1 card. This will give you 2 radio ports. 1 hard wired for 1200 baud afsk to the radio and 1 with +/-12v or 0/+5v signal for an external modem you can use for 9600 baud later. Recent versions of NOS support the DRSI card with the "attach scc" command. (This is an internal bus plug in card)

Or you can use the serial port (COMx) and a simple TNC such as an MFJ 1270b.

For the ethernet connection the 3COM 3C509 card is supported by Russ Nelson at Crynwr software (originator of the "clarkson" drivers.) And is in the same price range as the DRSI card. (both are $150 or so)

CAPRA, the Chicago Area Packet Radio Association, has received
information about 23cm microwave digital transceivers and other
equipment from a group of German amateurs.

We now have about 80 pages of documentation, theory, schematics, and
other information which details the equipment which has been developed
by this group of hams.

Unfortunately, all of the information is in German. We haven't found
any volunteers - at least not yet, in our area, who would be willing
to provide a translation for the material.

If you would considering offering your services, we would be most
grateful.

To discuss the matter, please call me at (708) 253-0046 in NW suburban
Chicago. In not here, I'll return your call at whatever time is
convenient for you.

One note - the materials are obviously of a technical nature; we
suspect that a knowledge of basic German, while helpful, will be
inadequate. However, if you are you are quite fluent in the language
or have a strong technical background, this may be sufficient.

Subject: PacketMac + SoftKiss + NetMac + IM/Mac lockup
Message-ID: <CCntMA.LBG@aardvark.rain.com>
Summary: my Centris locks up
Organization: Steve's UNIX System, Portland, Oregon
Date: Wed, 1 Sep 1993 05:22:57 GMT
Lines: 21

I'm having troubles with my software setup. I guess the first problem is
that I didn't RTFM, mainly because there is NO FM! I can't get IM/Mac
setup properly, and when I try to send files it locks up (and even writes
directly to video memory!)

I also have problems with lockups occuring at random times. This even
happens when I turn off all the other extensions.

OK, so does anyone have any suggestions? Do you think it's because I
still owe Dexter Francis $5? The local packeteers are about ready to
string me up, especially since the Centris locks up with the modem still
sending a steady tone!

Help.

Well, I have a thought, as far as a general answer goes...

My guess is that something triggered the terminal emulator to transmit
some sort of data. The TNC would then send this in UI frames.

By the way, if you set up the TNC to not monitor any traffic while not
connected, you should be able to avoid this.

-Seth

Since there has been some chatter recently about TheNET X-1J on the newsgroup,
and I never sent this out in the first place, now might be an appropriate time

to do so...
- -
Mark Skelton, N7CTM and I came up with this modification for MFJ 1270Bs running TheNET X-1G. The motivation came from the fact that our parts drawers were bulging with 27256 ROMs and we had a less than effortless time finding 27512 EPROMs (as called for in the X-1G installation instructions). We saw no reason why it couldn't be done so we made it a nice project for the day after Christmas 1992. It shouldn't be done by someone who is unaware of which end of the iron is hot.

The mod has been reviewed solo by each of us. It has a number of steps all of which should be read and understood before you start. I have an MFJ 1270B in service as a NOS front-end using the mod. The operation has been as reliable as that using the specified 27512 I was using beforehand. It has now run for 10 months (a realistic trial period) with no more problems than the local NetRom and TheNET nodes.

That this will work for anyone else is not certain. No guarantee is expressed or implied by either Mark or I. We will assume no liability for equipment failures or damage caused by or occuring during the modification procedure or subsequent use. Your mileage will undoubtedly vary.

Reid, WB7CJO Internet: Fletcher @ Moho.UWyo.Edu
Amateur AX.25: WB7CJO @ N7MMC.WY.USA.NOAM

~~~~~~~ 2x27256~~.doc 8-Jan-1993 ~~~~~~

This modification will allow a user to install TheNET X-1G in an MFJ-1270B TNC using two 27256 EPROMS in lieu of the higher capacity 27512 EPROM. This may be desirable due to the availability or lower cost of the 27256 type ROMs.

All of the following steps can be performed on the bottom of the printed circuit board.

1) Install a jumper from U-23/pin-1 to U-24/pin-1.

2) Cut the trace running from U-24/pin-27 to U-25/pin-27.

3) Cut the trace running from U-24/pin-26 to U-24/pin 28.

4) Install a jumper from U-23/pin-27 to U-24/pin-27.

5) Install a jumper from U-24/pin-26 to U-23/pin-26. A trace from U-23/pin-26 runs by U-24/pin-26. A solder bridge from this trace to pin 26 on U-24 is easiest to do.

6) Cut the trace between U-12/pins 13 & 14.

7) Install a jumper from U-22/pin-16 to U-12/pin-13

8) Cut the trace running from U-13/pin-2 to U-24/pin-20. It is suggested that the cut be made on the bottom of the board at U-13 next to pin 2.
~~~~~~~

 9) Install a jumper from U-12/pin-10 to U-24/pin-20.

10) TheNET X-1G binary is distributed as two 32K binary files. Normally the
    two files are combined and programmed into a single 27512 EPROM. For
    this modification the two binary files are programmed into each of two
    27256 EPROMS. Insert the ROM containing the first binary file in the
    socket for U-23. Insert the ROM containing the second file in the U-24
    socket.

Note: To restore the TNC to original operation as a TNC, remove the two
       X-1G ROMs in U-23 & U-24, install the original TNC2 ROM in U-23,
       remove the jumper from U-20/pin-16 to U-12/pin-13, and install a
       jumper between U-12/pins 13 & 14.

>rec.radio.amateur.digital.rtty
>rec.radio.amateur.digital.pactor
>rec.radio.amateur.digital.equipment

And, in fact, that's what the people who thrashed out the new group proposal
suggested. Well, r.r.a.d.tcpip and r.r.a.d.misc, at least. However, due
to an (apparent) lack of interest, r.r.a.d.tcpip did not pass. My intent
was (after the 6 month waiting period for retrying votes times out) to
~~~~~~

start up discussion about (at least) r.r.a.d.tcpip, r.r.a.d.packet, and
r.r.a.d.hf-modes (or something approximately like that).

However, all that has to wait (per the Guidelines) until 6 months after
the previous RFD for related groups. Which will be sometime in December,
if I remember the history right. I was planning on around Jan 94 to
start discussion.

flame mode on

If you were displeased with the outcome of the vote, or don't understand
why r.r.a.packet was renamed, maybe you should've paid more attention when
the RFD (Request For Discussion) was posted. Or at least voted!
Final word on voting: If you don't vote, you can't bitch.

For those who care, all information that was posted to news.groups or
to the rra-reorg mailing list is availabe for FTP from amdahl.com. I
don't remember where, though... browse around. This will be the place
to read all of the discussion that went on with respect to the changes,
and to see what the rationale was.

flame mode off

Phew, much better.

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History

=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in

rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Most of these proposed groups were in the reorg vote. They all
failed except the rename of rec.radio.amateur.packet to
rec.radio.amateur.digital.misc. Since they failed, they can't
be reproposed for 6 months under the Usenet guidelines.

We need to wait and see if there's sufficient traffic about these
other subjects over the next six months to warrant creating separate
groups. Note, under the guidelines at least 100 votes have to be
cast in favor of a group before it passes. If we don't see at least
100 RTTY posters, or PACTOR posters, etc over the next six months,
then calling for a new vote is likely pointless. We haven't seen
that volume in the past, but the name change to digital.misc may
attract more of that sort of thing over the waiting period.

You didnt say what kinds of lockups you had. But, they might
not be from a parameter problem at all. More likely RF from your
radio is getting into your computer, and killing it. This is a very
common problem, even with ATs, but easily solved. Ground everything
(radio, 486, TNC if metal), and put ferrites on all the cables, and
your antenna coax. I'll bet the problem goes away.

Summary: Using Baycom/PMP on the HP95LX
Keywords: HP95 Baycom packet

Has anyone found a way to run Baycom or Poor Man Packet TNC eumlators on
the HP95LX with it's non-standard three wire serial port? PMP uses the
parallel port to pass data, Baycom uses the serial port but both use more
than the three lines available in the HP95. The combination of a handheld
and a palmtop makes a VERY portable packet operation. If you have any
experience or suggestions in this area please drop me a line.

FOUR CYLINDER AIR COOLED WISCONSIN GASOLINE POWERED ENGINE FOR SALE

I have a few rebuilt (overhauled) Wisconsin Military Spec gasoline
powered four (4) cylinder engines remaining for sale. These engines were
formerly used in the Army's 1200 GPM decontamination sprayers and are in
excellent condition. Most engines have approximately 100 hours since a
COMPLETE overhaul and rebuild.

The engines have the following specifications:

4 cylinder horizontally opposed with 84 cubic inch displacement
4 stroke OHV engine with 3" bore X 3" inch stroke
Compression ratio approximately 7.2:1 (runs on LOW octane gasoline)
Approximately 40 Horsepower at 3600 RPM
Adjustable governor presently set for 3600 RPM
Engine will work perfectly with throttle cable instead of governor
Bendix carburetor with adjustable high and low speed jets
Manual and/or solenoid operated choke
Mechanical fuel pump for drawing fuel from remote tank
Completely enclosed ignition system with Fairbanks Morse magneto
Cartridge type oil filter easily converted to "Spin On" type
Low oil pressure sensor and shutoff switch (can be bypassed)
Cooling fan built into flywheel
Built in 24 volt 40 Amp alternator with regulator and rectifiers
Electric starter available (Engine can be started with rope)
Dual exhaust, dual muffler system with crossover pipe

Need an easily fabricated top sheet metal cover for your special installation. Will run fine without this cover but components (Carb, magneto, fuel pump, oil pressure sending unit, etc.) on top are exposed.

Original cost to government > $3500 each

$250 without Electric Starter FOB Baton Rouge, LA
$300 with Electric Starter FOB Baton Rouge, LA

Possible uses are:

This air cooled engine is ideal for use in large "mudboats".
Powering Industrial Air Compressors for Painting and Sand Blasting
Powering Emergency Water Pumps for Flood Duty
Powering High Pressure Water Pumps for Industrial Cleaning Uses.
Powering Medium Size Farm and Garden Tractors
Powering 120/240 volt 60 Hz Generators for Emergency use
(Will Power up to 15 KW Generator.)

THIS ENGINE WILL POWER AN INDUSTRIAL WELDING MACHINE!

Weight: Approximately 250 pounds each
Dimensions: 32" Length, 32" Width, 27" Height

Fuel Consumption: Approximately 1.0 gallon per hour at half load
Approximately 2.2 gallon per hour at full load

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been refurbished and is offered for sale. The unit has a manually variable voltage output of about 16 to 36 volts at up to 105 Amps continuous operation. The generator will provide approximately 200 Amps intermediately if the circuit breaker is bypassed. These generators were originally designed to power military radio transmitters under extreme conditions or "jump start" large diesel engines in trucks and tanks.

IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5 to 30 volts at about 35 Amps per leg. The AC output is then brought through a bridge rectifier array to provide the DC power in the same manner as the alternator in your car. I have run regular 60 Hz items like a refrigerator, fan or coffee pot directly off a step up (28 v to 110v) transformer connected to one leg of the output of the generator. Higher 60 Hz voltages are available if the regulator is modified!

The generators are powered by a heavy duty four (4) cylinder air cooled industrial (Wisconsin) engine of 32 cubic inches and produce about 16 horsepower using ANY type of gasoline. The engines have a protected Fairbanks Morse ignition system designed to start and run under the worst weather conditions. This engine package is also used to power a military standard 5 KW or 10 KW 120/240 volt 60 Hz generator instead of the 28 volt DC generator.

The military engines are easy to maintain and operate and come equipped with a replaceable cartridge type oil filter and mechanical fuel pump allowing gasoline to be drawn from the integral 3.75 gallon tank or an auxiliary fuel tank. Repair parts are available at any auto supply outlet or outboard motor supply business. These generators were designed to be "GI proof" and have been maintained and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Providing "backup" power for solar systems.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
Conversion to 120/240 volt 60 Hz generators for emergency use.

Original cost to the US Government: $3467.00
Price: $600 each with Rope Starter   FOB Baton Rouge, LA.
$675 each with Electric Starter FOB Baton Rouge, LA.

Weight: 275 pounds each
Dimensions: 35" Length, 24" Width, 25" Height
Fuel Consumption: Approximately 1 gallon per hour at full load

->   I also have a 1.5 KW gasoline powered 16 to 36 volt DC generator for sale. This generator has been used to jump start 24 volt diesel engine starters on both generators and trucks. The generator is military surplus and is in excellent condition.

Trond-

I have both the Heath HK-21 and the Pac-Comm HandiePacket TNC's. They each
have internal NiCd batteries, and draw only a few milliamps.

The HK-21 has absolutely no shielding, so you can't use it anywhere near
the receiving antenna. The hash it puts out makes use with a nearby
handheld transceiver nearly impossible, except with the strongest signals.
It also has an internal oscillator with a harmonic near 145.01 MHz.

The Pac-Comm HandiePacket is fairly well shielded, and would probably be
just what you're looking for, although slightly larger than the Heath.
Pac-Comm is located in Tampa, Florida, but I don't have an address handy.

I understand the Russian Space Station MIR, is using a Pac-Comm
HandiePacket TNC. (They were recently heard on 145.550, using
R0MIR/R0MIR-1 call letters on packet, and "Space Station MIR" on voice.)

>your antenna coax. I'll bet the problem goes away.

It doesn't lock up, and, in fact, it may be working fine, but I get
more retries and connect failures than I'd like. It may just
be the setup. It seems to hear fine. For example, I'll copy stuff
sent by an Oklahoma City BBS just fine, but can't connect with
it.

One approach is an A/B test where everything is the same (radio,
computer, settings, etc.) except use the Baypac with Baycom
instead of my PK232 (which I normally use with a base rig)
with, say, PC-Pakratt. However, I didn't really want to
make up a set of cables to hook my HT up to the PK232,
especially since this is a combination I'm not going to want to
use often, if ever.

Basically I was hoping somebody would say "Oh, yeah, I had trouble
connecting with stations when I used the default settings in Baycom
but when I changed the framistat setting to 75 quarks [or turned
the volume on the 24AT to blah, blah, blah; or turned the level control
on the Baypac to blah, blah, blah] I suddenly could connect to BBSs on
Jupiter." In other words a) I'm lazy and b) I was hoping for a miracle!

Thanks, anyhow, for your reply, and I will explore the RFI possibility.

Of course, the question will be(consider this a preview of what the
discussion will look like in news.groups when this RFD gets cranking in a
few months): is there sufficient traffic to justify the new groups?
Obviously, there will be another try at creation of rrad.tcpip. Based
on what I've seen recently, rrad.packet will probably be in the running
also. But is there really enough RTTY, AMTOR, or PACTOR traffic on here to
justify a separate newsgroup for them? In the end, I think they will be
left to rrad.misc until enough long-term traffic shows up to justify
creating separate groups.

The 56 kbps frequencies in GA, ALA and TN are all in the 220 band. In
the ALANET 56 kbps network, we use 223.850. I am not sure what GRAPES
uses. Contact Bruce Nebergall at k4tql@k4tql.ga.usa.na

The 56kb signalls are 70 khz wide and cannot be even be detected by any
radio that I know of. The only method that I have used to even detect
the signal is using a spectrum analyzer and even then the signal is so
fast that it is hard to see unless there is a file xfer between 56kb
systems going on.

There was a fellow in the packet demo room at the Huntsville Hamfest that
had a spectrum analyzer and wanted to see the signal. He asked for
someone to do a nodes list and was very surprised to not even see it go
by. Let's see: 500 byte long node list / 7000 bytes/sec. The longest
signal is the carrier bring up time.

If you weren't at HSV, you missed a fine packet demo/forum. There was
the 56kb stuff, 9600 baud modems/radio mods, TCP/IP. After the 9600 baud
forum, at least 4 9600 modems were bought by folks from ALANET, so expect
some action there real soon. (One of them goes on the 56kb switch in
Birmingham). And one on my station, heh heh.

Speaking of HSV, I want to congratulate Bob Shaefer,
ka4pkb@k4ry.al.usa.na or rlsnsdl@eng.auburn.edu for coordinating the fine
showing at HSV. His work resulted in some outstanding demos and forums.

INSOFT-L on LISTSERV@CIS.VUTBR.CZ   Internationalization of Software
                                    Discussion List

   Internationalization of software relates to two subjects:

        1. Software that is written so a user can easily change the
           language of the interface;

        2. Versions of software, such as Czech WordPerfect, whose
           interface language differs from the original product.

   Topics discussed on this list include:

-- Techniques for developing new software

-- Techniques for converting existing software

-- Internationalization tools

-- Announcements of internationalized public domain software

-- Announcements of foreign-language versions of commercial
software

-- Calls for papers

-- Conference announcements

-- References to documentation related to the
internationalization of software

This list is moderated.

larryk@mom.computone.com (larry kollar) writes:

I know the subject says it all. But why do you associate 9600 baud with
70cm? (I missed that in my first reply). 19,200 is OK on 2M as far as
the FCC is concerned.

56kb is the next step on 220 and 440. On 900 mhz and above, I think it
is pretty well whatever you can devise as long as the signal doesn't go
out of band.

There is a "traditional" relationship between bits/second and baud.
However, they ain't really the same (I am talking the signalling level,
not stuff like V.42bis compression). I ask Gary Coffman at Destructive
Testing Systems to comment on the bits/sec vs baud.

Also, pls start posting the kind of stuff to 'r.r.a.d.m' instead of
'r.r.a.p' since r.r.a.p is going away. What is the date? 9/21/93?

56kb in California is conducted on 433.050 MHz. This is within the
lower sideband of ATV on 434 MHz, but seems to coexist quite well.

I think this channel is in use elsewhere in the USA as well.

Actually, in the Atlanta area we use a frequency in the 433 MHz band
alternated with a 223 MHz frequency to avoid node to node interference.
There is a 9600 baud duplex repeater outputing on 442.00, input +5 MHz,
on Sweat Mtn near Marietta. A second 440 duplex system is being installed
on Lanier Mtn near Snellville. I don't know the frequencies yet. There's
also a simplex frequency in the 440.0xx area used by the IBM club.

>fast that it is hard to see unless there is a file xfer between 56kb
>systems going on.

A FRG7 in FM wide mode will unsquelch on the signal. It sounds like
a burst of white noise. Any communications analyzer with the FM wide
position can hear the 56 kb outputs. If you have a Motorola 2000,
it will even display the eye patterns.

There's starting to be a lot of 9600 baud interest in the Atlanta
area now that it's off the shelf. I urge anyone interested in packet,
1200, 9600, or 56 kb, to attend either an East LAN or West LAN
meeting to find out more and meet the guys. West LAN meets on the
first Saturday of the month at a branch of the Cobb library at 11 am.
The East LAN meets the second Saturday of the month at the Scott Blvd
Baptist Church at 10 am. I'm biased, but East LAN puts on the better
meeting, has free coffee and donuts, and has a larger attendance.

Gary

>the FCC is concerned.

Well not quite. The FCC allows baud rates as high as 19.6 kb on 2 meters,
but they also want us to contain our signals in 20 kHz. With the modulation
methods in use, basically straight FSK, 19.2 kb doesn't fit in 20 kHz. The
major energy bandwidth of straight FSK is about 2X the baud rate. It's
actually more, but for our purposes, that's close enough. 9600 baud FSK is
just OK on 2 meters, but the packet frequencies in most areas are already
full of 1200 baud signals, and the two don't coexist well with current
carrier detect circuits. So the general trend is to move on up to 70 cm,
the next band with lots of commercial equipment available, leaving 223 MHz
for longer distance trunks at 9600 and 56kb.

That's actually a good plan because local LANs (I know they should be
called MANs, but the terminology is already corrupted) shouldn't be
on frequencies with excessive long distance propagation. That allows
more spectral reuse via geographic spacing.

>56kb is the next step on 220 and 440. On 900 mhz and above, I think it
>is pretty well whatever you can devise as long as the signal doesn't go

That's right.

>There is a "traditional" relationship between bits/second and baud.
>However, they ain't really the same (I am talking the signalling level,
>not stuff like V.42bis compression). I ask Gary Coffman at Destructive
>Testing Systems to comment on the bits/sec vs baud.

In older amateur modulation technology, bits per second and baud were
one and the same, but that changes with more modern signaling methods.
Now we have modulating methods such as BPSK, QPSK, and QAM in addition
to the old standby FSK. In these methods, a baud may represent more than
one bit. The baud is the quantum of the digital modulation world.
It's the smallest change in the signal that represents information. In
quadrature systems, a baud can represent two bits of information. There
are 4 distinct states in a quadrature system, 0,1,2,3, which in binary
is 2 bits. Moving from one state to another only takes one baud, but
it transmits two bits. There are more complex constellations possible,
with the next step up normally a 16 way modulation which encodes a
nibble, 4 bits, per baud.

This wizardry isn't free, however. The more complex waveform required
may actually take up more bandwidth than straight FSK, though with a
different energy spectrum. Clever spectrum folding can fit these modulations
in a narrow bandwidth, such as in the Clover system, or in high speed
telephone modems, but DSP is almost a necessity to make a workable system.

In order to use minimum bandwidth for a given signalling rate without
spectrum folding, a method called MSK, or Minimum Shift Keying may be
applied. As implemented in the GRAPES modem, this system has a minimum
quantum of a 90 degree phase shift of the carrier. Backward to represent
a state change, and forward to represent no change of state. This is the
baud of the system, and it's also the bits per second of the system. It's
basically a 14 kHz rate modulation of a 56 kilobaud data stream. The data
is in NRZI format and there is a randomizer, or scrambler of 17 bits length.
This creates a pattern that repeats every 131,071 clock pulses and guarantees
a transition for every clock pulse. The GRAPES modem actually uses a modified
form of MSK to reduce bandwidth. There is a 3 db amplitude variation imposed
on the transition waveforms so that the spectrum is tightly contained at
1.2 Hz per baud. Thus a 56 kb data stream can be fitted into a 70 kHz channel.
With normal AFSKed FM, as used at 1200 baud on the amateur bands, a 20 kHz
channel is required, making it about 14 times less efficient.

Can anyone out there using the KPC-3 to DJ-580T combination please tell
me what the wiring connections are from the KPC-3 to the DJ-580T ?

I am not worried about doing it by the book, but would feel better to
knowing whether there are resitors, diodes, etc. that are required that
are not obvious from the books.

Thanks !

I'm planning on touring a large part of the Southwestern US this fall, and am curious if it would be possible to send and possibly receive mail from people on the Internet using packet radio. I have an Alinco DR110 mobile radio and a laptop computer, so all I need to complete a portable packet station should be a TNC and a modem. Before I go out and spend the money on this equipment, I'd like to know if I'll be able to use it as I intend. Has anyone done this before? Although I don't see any logistical problems with sending email (assuming gateways are available), receiving email could be a problem given that I'll be moving around quite a bit.

The Baypac BP-1 is the size of a DB-25 connector and its cover,
and it self powered off of the serial port. Drawbacks are that
it may not work with some serial ports that don't have the
proper 12 volt RS-232 levels, and it is not TAPR2 compatible.
The software that it comes with does generally work well for
most users, though.

I have a Kenwood TS-130S and a KAm. I have been trying out HF
packet and am getting very frustrated. I can copy just fine and
have actually made a couple of connections, but, after connecting
I can't seem to get any farther, so I end up disconnecting.
I have parms set to what several HF PAcketeers reccommend, but
no success.
Any suggestions ? Is it worth my efforts to try HF packet on
this rig? (BTW, RTTY and AMTOR work FB).

 DM> station and also to have some fun with Satelites.

By all means, get the 440 band as well. This will allow you to get a
9600 bps packet modem going on 440. Also, you'll have more up/downlink
choices with both 2m/.7m transmit and receive. And serious 70cm beams
are a lot easier to handle than 2m, since they are roughly a third as
large as the 2m equivalent.

Uhhh, evolution in action is generally fatal for most participants...

How's the quality of your electrical power? It might be worth a $120
bucks to get a UPS if you have surges, spikes, sags, brownouts, etc.

I used to have horrible problems with local power here until I put in
a good UPS. No more lost files, mysterious reboots, etc. Seems that
the nearest power generating facility changed generators every morning
about 10 am. They weren't particularly concerned with syncing the
generator coming on line with the current generator. When I complained
I was told that the light bulbs seemed to like it just fine......

Oh, and yes, I DO use DOS 6.0. (I just don't use disk compression.)

---------- TRANSMITTED BY ZL1AMW ----------
---------- H A M I L T O N ----------
15 August 1993

This is a weekly unofficial bulletin of news and views from ZL amateurs. It does not represent any official viewpoint, and all opinions are those of the contributor.

National Forwarding
---------- From ZL1AMW

The 900 UHF repeater at Klondyke (the Auckland end of the National System) is currently off-air. I have heard that there has been a failure of a control device at the repeater site, and it may be off for a few more days. This repeater is essential for forwarding to and from the Northland, Auckland, Waikato and Rotorua areas, so things are fairly quiet on packet for much of the amateur population.

Without the forwarding, this bulletin will be late arriving at a number of locations, so it would be useful if operators receiving good copy on the RTTY transmission upload the text onto their local BBS for others. The trick is to ensure you use the same BID, or Bulletin Identifier as is used when first despatching the sheet by packet, that way, when the forwarding restores, your local BBS will reject any further copies.

For those unfamiliar with uploading bulletins, all that is required is to use the SB (send bulletin) command in place of the usual SP (send personal) command. The news is usually send to the address of NEWS, with an @ (at) NZ distribution address. To force a particular BID, you add a $ (dollar), then your chosen BID, which can be any sequence of up to 10 characters. I break the news into pages of approx 2000 characters, and list the BID range at the end of the transmission.

Lan-link note...
---------- from ZL2WJ

I have noted a couple of items on the PBBS recently which advised Lan-Link v 2.10 was available. I also advised via the Data news. I did supply a number of people with this version but followed up with a corrected upgrade to v 2.20. G3ZCZ originally intended to

produce a v 2.11 for Pactor with the MFJ, However he supplied a new exe file to overwrite the v 2.10 exe file and create V 2.20, with an apology for his self-inflicted bugs.
I understand this upgrade also includes Pactor for the MFJ 1278. If you are upgrading from v 2.0 or earlier it is necessary to unpack V 2.10 and then overwrite the exe file to create V 2.20.
I hope this is not too confusing. The usual disk and mailer will obtain same.

Path: !ZL2WA!ZL1UX!

SELCAL and who took it upon himself to leave messages of greeting to nearly every other regular user. These messages were returned and friendships began to develop and the traffic on the SELCAL increased.
RTTY has always been the 'friendly mode' but here we have one man who, through dedication to his philosophy of extending a 'helping' hand, has been responsible for much of the growth in RTTY usage within new Zealand.
I'm sure by now you will know that I'm talking about Ken ZL1ACS. To you Ken, a big thanks from the regulars (and new chums) for your unselfish efforts to extend the goodwill message of amateur radio.
Thank you.
73 De Doug

News from the Waikato
---------- from ZL1AMW
The ZL1UX Hamilton BBS suffered an antenna failure early this week, causing the signals on the data repeater port to be very weak and often unreadable.
Fast work by Doug ZL4FS isolated the problem as water entering an antenna tail, and normal service was restored by Wednesday.

The 144.65MHz port was not effected.

The OTO ZL1IS-1 digipeater has been refurbished over the past few weeks. The repeater site it uses (Rangitoto) is undergoing a complete re-wire, and so the amateur equipment operated from temporary arrangements for a few weeks, causing some interruption to services, however the opportunity was taken to remove and re-align the radio's and update the TNC, so service from the digipeater is noticeably better now.

Electrostatic Zap
---------- from ZL1ACS.

Static electricity is usually more of a nuisance than a hazard - however hazardous situations can occur. For example, in rising from a vinyl-covered chair when wearing insulated footwear, a person could easily develop a potential of up to 7,000 volts.

In defence establishments and production factories electrostatic energy is of concern because it can be well in excess of the minimum ignition threshold of many detonators, combustible gases and solvents.

Even lower electrostatic energies can be a problem with computer equipment where data can be corrupted and microcircuits damaged if discharge occurs to some metallic part of the computer. There were also hazards involved n mail sorting, filling hydrogen weather balloons and in the use of combustible anaesthetic gases in hospitals.

Problems with electrostatic charging can be overcome by taking actions including keeping the relative humidity above 40 percent, and using materials which will dissipate a charge such as wood and metal.

73 De Ken ZL1ACS

ZL1AMW SELCAL
---------- From ZL1AMW

After many reports of poor or non-existent signals on 40 metres over the past weeks, the ZL1AMW SELCAL has been shifted to 3545KHz from last Friday.

So far signals appear to be significantly better, and more reports are welcome. If you are speaking to other users of the SELCAL, please mention the change, as a number will have missed the notice, and maybe wondering why they cannot access any more on 40 metres!

With the shift, the RTTY broadcast of this sheet has also changed to 80 metres.

That cocludes the Data News for this week, this sheet is Prepared at the shack of ZL1AMW from contributions sent by post, RTTY and packet. Text is also obtained from packet BBS stations,
and Selcals on 7045/3545khz.

This news is transmitted weekly on Sunday mornings at 0930hrs (local) and repeated at 1900hrs. Both transmissions are on 3545khz. It is first sent in Baudot at 75 baud, then repeated in AMTOR mode B (FEC) on both occasions.

73 to all from Alan, ZL1AMW, 20 Lorne St., Hamilton.

>Of course, the question will be(consider this a preview of what the
>discussion will look like in news.groups when this RFD gets cranking in a
>few months): is there sufficient traffic to justify the new groups?

Yeah, agreed. When you propose a new newsgroup, you need to *know* that
you're putting your proposal out to some very skeptical masses that could,
and probably will, tear it apart. Of course, I'm not saying that's bad - the
net would be a big mess (well, bigger mess than it is :-) if it wasn't
difficult to make a new newsgroup.

>Obviously, there will be another try at creation of rrad.tcpip. Based
>on what I've seen recently, rrad.packet will probably be in the running
>also. But is there really enough RTTY, AMTOR, or PACTOR traffic on here to
>justify a separate newsgroup for them? In the end, I think they will be
>left to rrad.misc until enough long-term traffic shows up to justify
>creating separate groups.

I also would not be surprised if another try is made at r.r.a.d.tcpip. But
there was already quite a bit of resistance at moving the r.r.a.packet to
r.r.a.d.misc. I'll go with the flow on a r.r.a.d.packet but I would not
look forward to the mess that will cause with the mail lists again.

Anyway, it's still a long way off. Ben mentioned this but I'll expand on it.
r.r.a.d.tcpip failed the last vote so it has to wait 6 months before anyone
can try again. That will be January 1, 1994 for the earliest possible
posting of a Request for Discussion (RFD). Assuming that goes well, it will
be 21-30 days before voting can begin, which would also be 21-30 days. So,
no matter how enthusiastic anyone is for it, it can't happen before February
or March of next year. So be patient... let's properly settle into the new

groups we just got before jumping to make more.

If anyone's interested, I'd expect that the initial discussion for an RFD will happen on the "rec.radio.amateur working group" mail list - a collection of the volunteers who post periodic informational articles & FAQs, the moderator of rec.radio.info, some ARRL staff, and other regular participants in the rec.radio.amateur newsgroups. If you think you'd like to be a part of it or just watch, it's always open for you to join. Just send a message to rra-wg-request@amdahl.com and ask to join the list. Don't forget to include your callsign so you can be properly introduced to the group.

I heard there's a new chip for the Baycom type of modem that
replaces the once thats there now. It allows speeds up to
9600. Anyone have info about it? Spec, or even if it will work
by swaping the chips?

I was just reading my fax modem manual (class 1) and came across a fax
command that was described as sending data in an HDLC frame. Seems to me
that is the same frame type used for packet radio...got me thinking is
it possible to use this to send packet....it's a long-shot I think but
I figured I would ask.

I have two Tiny-2's to piggyback with The Net 2.10. Made a suitable
cable and took them to the remote site, but did not test the two TNCs.
One appeared to work perfectly. The other had illuminated STA and CON
lights immediately on turn on. I changed program switch on the back
to the optional program and it seemed better. Question, is it possible
the two chips were programmed with different locations on the 512 EPROM?
Both my local sources are mystified, including the fellow who burned
the chips.

I have noticed that the newest DSP units have "packet"
settings on them. They usually seem to be a narrow

200-400Hz in the usual range of most mark and space tones
for HF packet or pactor operations.

I'm a BBS Sysop with 2 HF ports. While the 15 meter port
does just fine when the band is open, the 40 meter port is
ofen swamped with QRM. I hope that DSP will improve things.

Does anyone have experience with using DSP for HF packet?
Does it help? How about for pactor?

From: michaelw@desaster.hanse.de (Michael Will)
Subject: 99p12-SLIP <-> DOS ka9q?
Organization: Vogon Headquarter
Date: Fri, 20 Aug 1993 17:47:42 GMT
Message-ID: <1993Aug20.174742.741@desaster.hanse.de>
Lines: 47

I crossposted this to rec.radio.amateur.packet, since there might be some
people which know ka9q by heart and might notice at once what I am doing
wrong...

Now my problem:

Somehow I do not succeed with my DOS-ka9q to Linux-SLIP-Link.
I have an oldish i286-12 running DOS with ka9q, ip 192.0.2.44
and a nice i386 with Linux 0.99p12 SLIP, (192.0.2.45) and do the following:

On DOS:
net.exe
     ip addr 192.0.2.44
     attach asy 0x03f8 4 slip s10 2048 1500 4096 38400 192.0.2.44
     route add default s10 192.0.2.44
     trace s10 111

On Linux:
dip -t
     remote 192.0.2.44
     port cua0
     speed 38400
     mode SLIP
route add 192.0.2.44

I could not do a "route add default 192.0.2.44"
resulted in a SIOCADDRT: Network is unreachable

ping 192.0.2.44 (does not work)
ping 192.0.2.45 (does work, its the local host).

btw,
 How can I tell ka9q to dialin so that I have not to disable the getty first,
 and more important, how do I tell ka9q and linux to communicate at all?

Cheers, Michael Will

Could someone who has done this sucessfully please tell me how??
I found one file that is written in assembler with no code for the
SPARC and numerous files being looked for in strange places that
don't exist on any machine here.

The README says it has compiled OK on a SUN, but I can't see how.

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been
refurbished and is offered for sale. The unit has a manually variable
voltage output of about 16 to 36 volts at up to 105 Amps continuous
operation. The generator will provide approximately 200 Amps
intermediately if the circuit breaker is bypassed. These generators were
originally designed to power military radio transmitters under extreme
conditions or "jump start" large diesel engines in trucks and tanks.

 IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5
to 30 volts at about 35 Amps per leg. The AC output is then brought
through a bridge rectifier array to provide the DC power in the same
manner as the alternator in your car. I have run regular 60 Hz items like
a refrigerator, fan or coffee pot directly off a step up (28 v to 110v)
transformer connected to one leg of the output of the generator. Higher
60 Hz voltages are available if the regulator is modified!

The generators are powered by a heavy duty four (4) cylinder air
cooled industrial (Wisconsin) engine of 32 cubic inches and produce about
16 horsepower using ANY type of gasoline. The engines have a protected
Fairbanks Morse ignition system designed to start and run under the worst

weather conditions. This engine package is also used to power a military standard 5 KW or 10 KW 120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come equipped with a replaceable cartridge type oil filter and mechanical fuel pump allowing gasoline to be drawn from the integral 3.75 gallon tank or an auxiliary fuel tank. Repair parts are available at any auto supply outlet or outboard motor supply business. These generators were designed to be "GI proof" and have been maintained and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Providing "backup" power for solar systems.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
Conversion to 120/240 volt 60 Hz generators for emergency use.

Original cost to the US Government: $3467.00
Price: $600 each with Rope Starter   FOB Baton Rouge, LA.
$675 each with Electric Starter FOB Baton Rouge, LA.

Weight: 275 pounds each
Dimensions: 35" Length, 24" Width, 25" Height
Fuel Consumption: Approximately 1 gallon per hour at full load

->   I also have a 1.5 KW gasoline powered 16 to 36 volt DC generator for sale. This generator has been used to jump start 24 volt diesel engine starters on both generators and trucks. The generator is military surplus and is in excellent condition.

3.0 KW GASOLINE POWERED 16 TO 36 VOLT DC GENERATOR FOR SALE

I have one military surplus cage mounted DC generator that has been refurbished and is offered for sale. The unit has a manually variable voltage output of about 16 to 36 volts at up to 105 Amps continuous operation. The generator will provide approximately 200 Amps intermediately if the circuit breaker is bypassed. These generators were originally designed to power military radio transmitters under extreme conditions or "jump start" large diesel engines in trucks and tanks.

IMPORTANT NEW INFORMATION

The generator package is a 60 Hz 3 phase AC generator producing 13.5 to 30 volts at about 35 Amps per leg. The AC output is then brought through a bridge rectifier array to provide the DC power in the same manner as the alternator in your car. This might sound kind of dumb or obvious, but is the 'broken' Tiny-2
getting enough 12v power to it? Is it stable? I have a Tiny-2 here, not
on TheNet, though, and it had a problem with the STA and CON staying on.
It turned out that it was a faulty "wall wart." After going straight to
my Astron supply, the problem seemed to be cured.

The Essex Packet group, and KEPAC are combining their efforts for one day in the near future, to bring you....
....The Combined Boot and Junk Sale...!

The event will take place on Sunday, September 19th, at the Rocheway Centre, Southend, and is hosted by the Southend and District Radio Society to whom thanks are also due.

The " Combined " theme continues, because we have actually arranged a boot sale, followed by a junk sale auction, for all things " Radio Amateurish..." Please dig out that junk, and bring it to the auction...!

Starting the day at 10 am is the car boot sale, this will take place in the car park unless it is raining, when (without the " boot " ...!) it will take place in the main hall. This part of the day will finish at noon, to be followed by a junk sale auction held in the main hall, commencing at 12-30 and finishing at 3 pm.

The car boot sale entrance fee is five pounds, which also entitles entrance for two, to the junk sale. Entry to the junk sale is otherwise 50p.

Items entered in the junk sale will be subject to the usual commission of 10%, with a minimum charge of 50p. The minimum fee will also be levied on items that do not reach their reserve price.

If a seller wishes to display their goods before the auction starts, the security of the items will be their own responsibility.

The auctioneer may split lots during the sale, so if a seller desires otherwise, this point must be made clear to the auctioneer beforehand.

Now you know how the junk sale auction is to be run, see what else we have for you...!

There will be a small selection of packet related shareware available, and an opportunity to join either (or both...!) of the two packet groups. Perhaps you have a packet related problem

that is bugging you ? Help will be on hand to point you in the right direction.

Also planned is the opportunity to have the deviation on your radio checked. For this, it is best if you bring along your TNC as well as your radio, the two items can then checked for optimum adjustments. (Don't forget power leads, connecting leads etc, although you do not need the computer...!).

A talk in station will be provided by the Southend and District Radio Society, on 145.550 Mhz, (S22).

Food and drink, (and " non-drivers " drink...!) will be available during the day.

You'll also get the chance to clear the loft, (and fill it again in the evening...But don't tell the XYL that part...!)

Last, but not least, you will have a chance to meet friends old and new, and meet the committees of the two groups.

As the day is a combined effort, both groups will share the running costs, and the profits (profits ? Did I use a naughty word ?...!), so your attendance will contribute to the future work done by both groups for the packet communities across the counties of Kent and Essex.

The event manger for the day is George, G1NNB (I lost the toss, which is also why the first line reads the EPG and KEPAC, rather than the other way round !)

This looks like being a good day, and we look forward to seeing you there.

Regards and 73,

Stan, G4EGH @ GB7EZB, Chairman, KEPAC. (I got in first...!)

George, G1NNB @ GB7ESX, Chairman, EPG.

I'm working on a host mode application for the AEA PK90. I need to determine if a connection is set up on a logical channel (similar to the hardware DCD connection when logical channels are not used). The manual says (on page 6-8) that link state is returned in response to a CO command. It is returned as the "link state-1, e.g., S05 is sent as $34". I cannot find in the manual where the numeric link states are listed. These MAY be in common to all equipment using AX25. Can anyone send me a list of link states by number?

THANKS!!!

Harold

****

The Digital Radio FAQ list will be posted on a monthly basis to rec.radio.amateur.digital.misc, rec.radio.info, rec.answers, and news.answers. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/digital-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

   3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a

test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available for FTP from ftp.cs.buffalo.edu and by mail from rtfm.mit.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite

communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over most of the other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously. No other digital mode gives this ability.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a

terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing

digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AMTOR - AMateur Teleprinting Over Radio. This protocol allows error-free point-to-point or multicast, single user per channel communications. Usually used on HF, but not VHF or above.

ARQ - Automatic Resend reQuest. This is the point-to-point error correcting mode for AMTOR. It works by sending bursts of 3 characters, and then the other station sends an OK/NotOK code for those 3 characters.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FEC - Forward Error Correction. This is the multicast method of (almost) error-corrected communications on AMTOR. It works by sending each character twice.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker

Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

RTTY - Radio TeleTYpe. This protocol allows point-to-point or multicast, single user per channel communications, without error correction.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come

out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio. This group will be deleted on 21 September!

rec.radio.amateur.digital.misc (Newsgroup): General discussions about all aspects of digital transmissions over Amateur Radio. This group is a replacement for rec.radio.amateur.packet.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Digital Amateur Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

telnet knuth.mtsu.edu 372

or

```
telnet 161.45.1.1 372
```

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

There appears to be a mailing list about NOS on hydra.carleton.ca, but I don't have much more detail. Send a message to nos-bbs-request@hydra.carleton.ca. The list name is nos-bbs@hydra.carelton.ca.

2.2 What anonymous FTP sites and electronic mail servers are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.
(I have one report (from George Hitz, W1DA) that this FTP site will be down until the end of this summer, 1993. Reportedly the site admin is

going to be in Sweden.)

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using
a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features
like scrolling or saving the windows, but the individual sessions can be
recorded into a file.

As for mail servers, there is only one that I know of at the moment:

Ham-Server@GRAFex.Cupertino.CA.US

This mail server, which is run by Steve Harding (KA6ETB), has a wide
variety of information on most aspects of amateur radio, not just digital
modes. Send a message with the body HELP to get a fairly useful listing.
Also note that Steve posts the index from the server approximately weekly
to rec.radio.amateur.misc, rec.radio.amateur.packet, and sbay.hams.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is
probably info@arrl.org. That is where general information about the
ARRL can be acquired. This address reaches a person, so you'll have
to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateways

There are currently two comprehensive gateways between the Internet and
the packet radio BBS system. One is run by Jim Durham, W2XO, in Pennysylvania
and the other, which allows access to PBBS bulletins, as well as mail,
is run by Bob Arasmith, N0ARY, in California.

2.4.1 The W2XO Gateway

To mail from Internet to Packet:

1.   Mail to: "bbs@w2xo.pgh.pa.us"

2.   Make the first line of the text a Packet BBS "send" command, ie:
SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

2.4.2 The N0ARY Internet mail <-> full packet BBS gateway

Bob Arasmith, N0ARY, runs a gateway between the Internet mail system and PBBS system. His gateway allows you to read, post, and respond to other postings on the PBBS system via email. For more information, send mail to gateway_info@arasmith.com.

2.4.3 LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

TCP/IP doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol (called IP) on top of AX.25. This is used to increase efficiency of its transmissions, since IP does not require packets to be "reliable", that is to say, guaranteed delivered error-free. TCP handles the retransmission of lost and garbled packets in its own way, at a higher level. Therefore the extra information in an AX.25 "VC" (virtual circuit) frame is not useful, and thus consuming needed bandwidth.

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

RF from my HF rig at some frequencies, 20m in particular causes my dumb terminal to lock up. I have to turn it off and back on to get it working again. This makes HF digital operation impossible on those bands. Ohter bands are ok. Disconnecting the keyboard and I/O cables doesn't prevent it but moving the terminal several feet away does cure it. There may be a little radiation from the ladder line feed line on the rig. I need to use this type feedline since I am using an "all band dipole" feed with a transmatch.

Any ideas?

Does anyone know if there are any problems with this
modem? I know a ham who is not able to receive very
well but can transmit just fine. I remember reading
corrections for this modem before but do not remember
the details.

In article <2472d8$ld7@apple.com> winter@apple.com (Patty Winter) writes:
 -- stuff deleted --
>There's another security issue. If you log onto a remote node over
>amateur radio (whether you're logging onto a non-Net 44 site from a
>Net 44 site, or vice versa), you're sending your password over the air.
>Sure, the odds are slim that anyone would both (1) be watching your
>packets at exactly that time, AND (2) want to use the information for
>nefarious purposes. But I sure wouldn't want to take the chance.

But... you are neglecting the fact that (at least in the JNOS variant)
KA9Q NOS contains
code that allows for the sysop to filter out nets/subnets/specific
hosts/specific ports
or ranges of ports in any direction across his/her gateway.

The command is: ip access <permit|deny> <parms>.

I must add to Patty's points :

 3) the IP address is assigned by the regional netadmin and should be in
the DNS at mirrorshades.
4) the IP address is routed to a specific radio port and possibly digi
path locally at the ip-switch/NOS   host.
5) semi-encrypted (number to letter keyed) passwords are supported and can
be used.
6) troublemakers would have to understand and circumvent all of the above.

This leads me to the conclusion that only a most determined and
knowledgable person would be
capable of doing #6. In most areas of the country, persons with the
potential to hack the system
ARE the sysop's or well known to the sysop. The bulk of users of AX-IP
wormholes and ampr - internet
access sites are still struggling with the complexities of their software
and the "how do I get to...??"
questions. At last scan NNTP access was still extremely experimental and
was being limited to very
small feeds of highly moderated groups.

There is more potential for abuse of packet BBS's if a NOS gateway sysop
has done his job.

Jack   KD4IZ.

I would be very grateful for instructions for modifying the ICOM 471A base
station 70cm rig for packet at 9600 bps.

Please mail to internet address kluxford@fcit-m1.fcit.monash.edu.au

Thanks.

I am not to happy to hear about the discontinuance of rec.radio.amateur.
packet nad putting it into rec.radio.amateur.digital.misc.
Packet is a very specific term and I don't want to have to read through
messages about all other sorts of digital modes to sort out packet ones.
WHY THE CHANGE ?

I urge you to leave rec.radio.amateur.packet alone and put those other
digital modes into the new group !

This is kind of last minute planning but, we are looking for amateurs in the
following states:Oklahoma, Arkansas, Louisiana, Missouri, Minnesota, Wisconsin
and Michigan to participate in a meteor scatter packet experiment. The setup
is simple, just monitor the channel and save all received packets to disk.
The band used will be 2m. If you would like to participate, e-mail me ASAP.
Include a phone number in your reply. Replies to the posting address are OK,
but replies to sparker@Coquina.cass.usu.edu or sparker@cedar.hao.ucar.edu are
preferred.

Does anyone know about Pasers (if they exist)? I read Masers use the laser
idea to generate microwaves. Pasers would then be for packets. :-)

Seriously, I think this idea has merit. If shortwave radio could be
generated in a coherent point to point beam, it could take advantage of
bounce which microwaves can't, adding both security and distance to packet
and other work. Not to mention the focussed beam would greatly reduce power
requirements.

Anyone with clues as to how to build such a gizmo please let me know.
Thanks.

>   claims or accusations, merely asking a question. No flames, please.

Any *competently* designed code for eavesdropping on packet frequencies
should suffer no harm from the process. There can be problems for poorly
designed code. For example, if software flow control is used, a control-S
in the binary data stream being monitored could cause the digital link
between TNC and computer to freeze until a control-Q comes along. Similarly
on the display end, a competent monitoring program would filter binary
sequences of screen control codes to prevent color changes and arbitrary
graphics from appearing on the screen. Better monitoring programs display
a hex dump of monitored transmissions and only attempt to print normal
ASCII printable characters to the screen. Non-printing characters are
displayed with a period placeholder.

It would be a very poorly designed system indeed that could actually
be damaged by the mere act of monitoring a digital data stream. For
such systems, think of it as evolution in action.

Gary

What is the part number for the chip with a faster slew rate than the
LM-324 op amp used in the MFJ-1270 TNC-2 clone? This mod is supposed
to allow use of the higher serial port baud rates. Thanks.

Did you vote in the newsgroup reorganization? If not, why not? If so,
well, you were on the losing end of this one. I voted in favor of having
digital.tcpip and would really like to see digital.packet as separate as
well. For that matter, a digital.internet-gateway would be useful.

digital.misc provides a place for discussion of the digital modes I like
the most, RTTY, Amtor and Pactor...

Ummm ... folks ... we already DID this ... and there was a vote,
and the vote was to change the hierarchy, and that is what is
happening. No point in fussing about it - that already happened!

Now if folks want to make yet another change ... use the normal
usenet mechanisms for change please, and let's get back to the
continuing nocode / repeater wars / etc. flamefests.

I have had a few email requests for instructions on how
to use my gateway, so here it is. Since I am running
N0ARY's code, there are no big differrences for those
of you who have his instructions.

There are still a few problems with the phone line, which
is why the phone number is not listed.

Enjoy.
           -pat   N6QMY   :-)

N6QMY/BBS Internet Gateway Operating Instructions
April 11, 1993

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem
port (510-xxx-xxxx) or via one of the 4 tnc ports (145.09, 145.79, 223.62,
or 441.50). Each local user has a bbs account that is used to customize
how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed
to their call will be forwarded via a gateway to internet and on to
other networks (mcimail, compuserve, etc). All the user needs to do is

enter his email address and turn the feature on.

```
  EMAIL bob@hal.com
  EMAIL ON
```

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

```
  EMAIL OFF
```

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N6QMY as well as users at other bbs's. Begin by sending a message to IPGATE@N6QMY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

```
  KB6UCZ de N6QMY >
    sp ipgate@n6qmy
  Enter your subject:
    Meeting?
  Enter your message body:
    To: bob@hal.com
    Are you planning to attend the club meeting on Thursday? Give me
    a call. 73, Theresa
    ^Z
```

NOTE: That the recipient cannot respond to the message unless they are a ham and registered with the gateway. He/she becomes registered by sending a message from his internet host to gateway-request@lbc.com.

REMOTE USERS:

Remote users are those that do not log into N6QMY directly but merely appear from the packet world to use it as home. If a packet user checks the "White Pages" for a remote user the entry comes back as @N6QMY. The packet user then address his message to YOURCALL@N6QMY and the bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address nor use the SP IPGATE method described above. From the packet network it appears that you are just another user at N6QMY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most bbs users in the US are represented in the database as well as many from other countries. When a user chooses a home bbs, that bbs generates an update that is sent to the regional servers and then distributed to

all the other bbs's. An entry consists of; call, home bbs, first name, zip, city and state. When a user wishes to send another packet user a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet into the bbs system he/she must register with the gateway. This is done by sending a message from the host that he/she intends to use to gateway-request@lbc.com with the following information:

```
  CALL:
  FIRST NAME:
  CITY & ST:
  ZIP:

  HOME BBS:
```

When a request is received the "From" field is copied directly into a file with the requesters call. Whenever the gateway receives a message bound for packet it scans this file comparing on the "From" field. When a match is found the gateway uses the associated call from then on. If there is no match the mailer bounces the message with a one-liner indicating the the user must register.

If you currently use another bbs as home this needs to be stated in the request. Otherwise you will be assigned N6QMY as your home. If you choose not to use N6QMY as your home you must make sure people know to send your message to YOURCALL@N6QMY.#NOCAL.CA.USA.NA to pass through the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to remote users by sending a message to the bbs. Here is a subset of the commands currently available.

LIST	listing messages
LOOKUP	look up calls in the on-line callbook
WHO call	dump a users account information
READ	read messages and files
USERS n	display the last n users to connect to the bbs
INFO	display manual pages of various topics
CD	change directories in the file system
LS/DIR	display the contents of a directory
WP call	look a user up in the "White Pages"
HELP	get help on how to use a command

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can
form very complex requests. For instance the following command
is valid on the bbs:

```
  LIST LAST 20 BULLETINS FROM N6QMY
  LIST ALL BULLETINS ABOUT KENWOOD
```

The ABOUT keyword is used to search the subjects of messages for a
given pattern, in this case KENWOOD. It can appear anywhere in the
subject line.

This is an example of how complex all the commands can become. They
can also be abbreviated down to the level understood my most other
bbs programs. Any of the following will give the same results.

```
  L< N6ZFJ
  LIST FROM N6ZFJ
  LIS < N6ZFJ
  L FR N6ZFJ
```

In most cases a minimum number of unique characters is needed to
distinguish a command.

You can get a list of commands and a translation chart from the
W0RLI BBS command set to the N0ARY BBS command set by typing
the following commands:

```
  INFO COMMANDS
  INFO W0RLI
```

Other commands that you may wish to execute are:

```
  INFO MANUAL
  HELP HELP
  HELP LIST
```

Now that you know what some of the commands are this is how you go
about executing them. You send a message to cmd@bbs.lbc.com
with your commands entered one per line or separated by semicolons.
For example if you want to know if three of your buddies are in
the white pages and if the bbs has any messages about the ICOM W2A.

Send to:

```
  cmd@bbs.lbc.com

  Subject: you can put anything here
  wp n0ary n6zfj n6une
  list all about w2a
  .
```

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send messages from his host through the gateway into the packet world. How much you have to specify of a users address depends on how much the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to the N6QMY bbs, which many of them are, you simply need to supply the call of the user.

  n6oim@bbs.lbc.com

If the N6QMY bbs doesn't know of the user but does know where his home bbs is, then you need to supply just the home bbs call in addition to the users.

  n6oim%n6iiu@bbs.lbc.com

Notice that the call and home bbs are separated by a percent sign '%' rather then the '@' which is used in the packet domain. This is because the '@' has a meaning in the internet address.

If the N6QMY bbs has no knowledge of either the user or his home bbs, then you probably have the wrong home bbs or it is a new bbs. In which case you will have to supply the full address so the bbs will know how to route the message.

  n6oim%n6iiu.#nocal.ca.usa.na@bbs.lbc.com

This level of addressing is hardly ever needed and normally means that the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up of a keyword, which can be any six character word and a distribution. Distributions are local to an area. For instance SBAY is valid in northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:

ALLUS	*please avoid this one*
ALLUSW	all western US
ALLCA	all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

Send to:

  want%allca@bbs.lbc.com

  Subject: Kenwood TS440, CW filter
  If you have one of these you are willing to part with please
  give me a call or leave message, thanks.

```
  73, KB6UCZ@N6QMY.#NOCAL.CA.USA.NA
  .
```

Be descriptive, brief, and always include your full return address in the message. Also please try to limit your distributions to small regions. Using the ALLUS distribution really slows down the flow of messages.

INFO ON THE N6QMY BBS:

The bbs came into being in April of 1993 and was the second one anywhere to run the N0ARY BBS code (the first being N0ARY himself). The bbs has 4 rf ports, 2 phone ports, the internet port, and is working on a voice synthesizer port. The latter would allow users to check for messages via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was written by Bob Arasmith (N0ARY) to focus on the user. Great care was taken to make the bbs very forgiving to the novice user but very flexible and powerful for the old-timer. The bbs can be configured to interact with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available later this year as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs in general please drop me a message.

73, -pat

O.K. I am new ti internet. Just WHAT would it take to leave the
.packet newsgroup in existence and use the new .digital for those
other digital modes?
Please give me info on how to approach this. I do not know the
procedures or who are the "GODS" of the heirarchies !

These problems have been noted while using RLI and BPQ code. Can the "user"
implement any of these "filters"? I have had recent strange scrambling of
the hard drive (No, I'm not using DOS 6!) and yesterday when I came home I
found CHKDSK/F partially involked and locked up. The only normal way for
this to happen would be if a reboot caused it .... or if there had been an AC
mains dump - and there wasn't. Could any HEX code flying by cause this -

or am I chasing shadows?

I also have a TigerTronics TNC that I have been using for about a year. When
I was using it on a 286 PC things seemed to work pretty well. When I
upgraded my PC to a 486DX strange things started happening. I could
connect ok to the BBS I had been using, but after only part of the
initial message is received, things seem to just lock-up.

My first attempt to resolve the lock-up problem was to set maximum
values for all the times found in the set up file. At least I don't seem
to be getting the lock-up problem I had before. Now that the "shotgun"
approach seems to have helped, I plan to reset the various time values
to their original values and see if I can detect any adverse effect.

I would also be interested to know if anyone has a better understanding
of the Baycom software and has any suggestions regarding appropriate
values that should be used.

Summary: How to decode
Keywords: Motorola , MDT

Greetings,
I'm not sure if this is the right group, but I try anyway..
Can anyone provide any info, or direct me to a source of info
on how to decode the Motorola MDT's in use by many public service
agencies these days? I would like to monitor these packet transmissions
. I need to know what protocol is used, baud rate, FSK? , legality,
any source (other that Motorola) that sells a device to do this. And
any encryption they may use. Any info would be greatly appreciated.
If you post a reply to this, please send email to this account also,
I am not able to regularly read usenet.
Thanks,
   Lori

Hi,

I'm a packet newbie, so please excuse me if there's a FAQ somewhere that
should tell me this . . .

Is there a Macintosh packet-control program that I could use with my
PowerBook and new KPC-3? I'm using a terminal emultion program, which
works OK, but I heard rumors that there's a packet-specific program out
there somewhere which allows serparate streams in independent windows and
"split screen" for convers mode. Seems ideal, but who/where does one
contact?

Thanks, 73 & CUL,

     Okay, Im not sure if this is the appropriate newsgroup to post
to, but... What regulations are there in the U.S. about broadcasting
encrypted message packets that cant be broken by the pigs, especially
in communication with other countries? How strictly are they enforced?
Are there ways around it (both legally and illegally)?

     Thanks...

Well our normal amateur transmitters are coherent sources, at least
they are if they are working properly, spark was outlawed a long
time ago. Since they are coherent, the signals are capable of being
focused into tight beams. All you need is an adequately large antenna.
In the case of lasers, the mirrors and collimating lenses are the
equivalent of our antennas. To get the tight beam of a laser, the
"antenna" has to be several million wavelengths in diameter. That's
only 6 inches at light frequencies, but it's a tad bigger down at
HF.

Gary

Hello,

I am looking for a Kantronic's D4-10 10 watt radio. Its for a high speed data link for the bbs I am putting up in Springfield, Ohio. Also, If anyone has a Ottawa PI controler card for the Kantronic D4-10 or a duel port controler made by Burcillous (I think that is how its spelled) for the radio.

If you have any of the above, call 513-325-3893 anytime and ask for Tony or Charles.

THanks!!!!

Tony N8XJA

In a word, GREAT. However, the BAYPAC BP-1 is *NOT* a TNC rather it is

a Packet Modem. The TNC is the software that comes with it. BAYCOM is designed toward the INTEL PC (IBM GATEWAY et al) and works equally well on an i8088 @4MHz or an i486-DX/2-66. I've bought three so far 'cause when others see how neat it is they usually want one ASAP. Well worth the $50. The only problem I've had is not a BAYPAC issue but finding connectors which fit my ICOM-24AT *PROPERLY*: RADIO SHACK connectors seem to run large in one lot an small in others. I'm going to try a standard microphone connector onof these days when I find some spare time.

I think you're chasing shadows. Do you have remote sysop functions enabled? If you do, it's just barely possible that the random characters you are monitoring hit your access code and then later generated a reboot command. But that's extremely farfetched. I think you probably have computer hardware problems.

I have heard of the Twincom (Moonachie NJ, 800-666-2496) ACI/550 board,
$70, which allegedly will let you use non-standard io port addresses
and interrupts.

Also, the Hayes Microcomputer Products (Atlanta GA 404-840-9200)
Communications Accelerator, $200-250, which has 2 16550 UARTS,
1024 byte buffers, and its own processor to allow DMA transfer.
I believe it uses its own driver, avoiding the brain-damaged
Windows comm driver limited to 19200 bps.

See PC Sources, April 93 for a nice discussion on configuring
and speeding up serial comms.

And if you make a vary configurable high speed board at a reasonable
cost, let me know!

 An> TH-28A HT. Is this radio acceptable
 An> for packet? I am looking for my callsign any day now (took the
 An> technician test on May 16).

 An> Jamie Anderson (ANDERJH@DUCVAX.AUBURN.EDU)
I presume you want a small, low power consumption unit? I suggest
the Kantronics Packet Communicator 3 (KPC3). The unit is appox.
5 inch by 5 inch by .75 inch. It uses 15-20 ma at 6-25 VDC. It
uses a 25 pin serial port connector. I used a standard 9 pin to 25
pin modem cable and an MFJ KAM VHF to KENWOOD HT cable (MFJ-5026Y).
This worked fine for both the Kenwood TH215A and my TH28A as well.

Consider getting a better, external antenna, perhaps a roll-up
half wave. Or use a 5/8 wave on a car. Or even a small portable
beam?

 AM> room. Does anybody make a radio modem for short-range networking, and
 AM> what's the policy regarding them (i.e., something where we don't have
 AM> to deal with the FCC too much).
There are many TCP/IP packages, and at least 3 commercial radio-based
networks for DOS/UNIX. NCR Wave Lan comes to mind. Contact a
professional networking guy, or call Inmac or Black Box. These may
be slow compared to standard co-ax Ethernet, approx 2 Mbits/sec.
You should be able to do this with off-the-shelf boards, drivers,
etc., all designed to be installed and used by ordinary businesses.
Hence low/no FCC hassle.

 BTB> Is there an easy way to identify bad AA NiCad batteries?
 BTB> (something that doesn't require any circuits other than a voltmeter?)

 BTB> KB8CNE, Brad Banko

Bad ones wear black leather, have tattoos and hang out on street corners
late at night. Good ones have pocket protectors, black framed glasses
held together by tape, and a slide rule (okay calculator) hanging from
their belt. Sorry.

73 Magazine has had a couple of recent articles on NiCad Zapper/Testers.
Apparently, you charge them and use them. If they don't hold a charge,
you zap them with high current to fry internal "whiskers" that tend to
short them. THEN charge them and use them. You may have to do this
a couple of times.

See 73 Amateur Radio Today:
    September 92 p. 24
    May 93 p. 68.

 TT> is the (physically)
 TT> smallest TNC available? I will only need to be active on vhf/uhf.
 TT> Power consumption is also an important factor.
 TT> It seems to me that a tnc could be made extremely small...

Heath used to make a TNC that was ideal for packet, about the size of

a box of 100 mm cigarettes. Gone now, I suppose.

Among more recent offerings, the Kantronics KPC3, about 5 x 5
x .75 inches. Apparently uses about 15ma at 6-25vDC. Costs
about $120. Includes PackeTerm software (which runs well from
floppy). You can turn off the LED displays if 15ma seems too
high |-). I've been using a 9 volt alkaline battery for months.
I may try the 6 volt lithium batteries from my wifes Polaroid
camera. Got to be SOMETHING useful to do with 'em.

There is room for a 9v battery inn the case, though my power
jack seems not to allow my internal connection to work. So
use the provided plug and connect my battery externally.

 KWF> First, is such an application legal?

Maybe not, if you are doing it just to bypass a commercial
communications facility.

 KWF> Second, I know 1200 baud is packet max but under what conditions may

1200 bps is not packet max. Like many other things, it's a matter of
money. How much speed do you want to pay for? 9600 bps is fairly common
on UHF (450 MHz), but equipment costs are higher.

 KWF> ``experiemental'' radio use higher baud? (The BBS has 14.4K)
 KWF> Third, what equipment should I buy for both ends?

You need a high gain antenna, a good transceiver, a TNC w/ 9600bps
packet modem, cables, packet software at each end. If there is no
convenient digipeater, you may need a pair of UHF amps and/or towers
to get good communications. Throw in some good co-ax, connectors, etc.

Perhaps $1000-1500 at each end, plus tower/amp as needed?
1200 bps is cheaper, $700/site?

N5SYY

Hi all;

     Just got my basic certification yesterday and am now in the
market for a handi talki with the goal (once cash flow improves) of
getting into packet.

     Shopping around Ottawa, I have narrowed my selection down
to two units:

1) ICOM IC-P2AT 2m band @ $375 canadian; and
2) ICOM IC-24AT 2m and 440 @ $460.

I am really new to all this and would like some advice on how I should proceed. Is the addition of 440 worth 85 canadian (aprox 43 cents US ;>). Any general comments about these radios?

Please remember that the untimate goal is to set up a packet station and also to have some fun with Satelites.

73 de VE3XMJ (Dave Mercer)

PS. If there are any packeteers out there from the Ottawa area, I would love to hear from you.

So, rather than just creating a group for RTTY and a group for Amtor and a group for Pactor a system was proposed that eliminated a group for discussing packet. Talk about throwing out the baby with the bath-water.

Contact me!! :)

The program you are looking for is called Savant. It is a multi-split-window,
multi-connection ax.25 packet radio program that follows the Macintosh
user interface in every detail. It works with any TNC that has KISS mode
(AEA, Kantronics, MFJ, etc). A demo version is available via anonymous ftp
at cpre1.ee.iastate.edu:/pub/ke0ph/Savant-1.0.1-demo.hqx.

Let me know if you have any questions or comments!

No, the group for discussion of packet is now .digital.misc ...
Nothing happened other than a change in name.

It seems to me that a vote was held to make this decision... I wonder where everyone was when that happened...

If you voted, you got your chance to participate in the decision process. If you failed to vote, you forfeited your right to gripe. Why don't you stop your whining.

There are a set of rules that govern the creation of a news group and when they allow we will have another vote. Perhaps more people will participate and we will get a different result.

>encrypted message packets that cant be broken by the pigs, especially
>in communication with other countries? How strictly are they enforced?
>Are there ways around it (both legally and illegally)?

It's specifically and near absolutely prohibited to use encrypted
signals to obscure meaning. The only exception is for certain
telecommand functions of amateur spacecraft, and even then the
encryption algorithm must be made available to the government on
request. As to how strictly it's enforced, the FCC rarely starts
an enforcement action unless it receives a complaint. On the other
hand, hams are quick to complain if they observe what they think is
illegal activity. So you might get away with it once or twice, but
if you start to make a regular scheduled practice of it, you're very
likely to get nailed. With *international* signals, there are other
administrations involved who may not be as casual as our FCC, and
the CIA and NSA might get curious as well.

While intentionally obscuring meaning is nearly always illegal,
if you are intent on breaking the law there are clever codes
and plaintext encryption schemes that can hide a message in
seemingly innocent plaintext. Unless someone is specifically
looking for them, they are hard to spot by casual monitoring.
Usually it requires traffic analysis to direct suspicion
toward this type of deception. If you arouse certain agencies'
interest, however, they can and will act.

> messages about all other sorts of digital modes to sort out packet ones.
> WHY THE CHANGE ?
> I urge you to leave rec.radio.amateur.packet alone and put those other
> digital modes into the new group !

The change is because part of the CFV for the rec.radio.amateur re-org
made provision for the removal of "old" groups made redundant under the
new group stucture. Of those who voted, a majority voted in favour of
creating rec.radio.amateur.digital.misc. The charter of the group
includes packet among the other digital modes, so
rec.radio.amateur.packet will be rmgroup'd sometime in September.

Once rec.radio.amateur.packet is rmgroup'd and you've had a chance to
find out just what sort of traffic is in rec.radio.amateur.digital.misc
and it turns out that there's high traffic of messages about all the
various digital modes and reading packet related messages is a pain, put
forward an RFD to create rec.radio.amateur.digital.packet group. If the
readership supports it's creation, then you'll have your packet group.

Cheers!

Let's get REAL, Appletalk has converted over to encrypted passwords.
Why can't this be implemented in the TCP/IP environment?
Are we waiting for the lan based community? shouldn't we do this
ourselves?

Just some network engineers ramblings about etherpeek and passwords :-).

While encryption to obscure meaning is prohibited, it is not prohibited
to use something like a zero-knowledge proof to verify a password. Note that
a zero-knowledge proof communicates information about the password without
communicating the password itself, and the information is not obscured.
It works this way:

    Prover: I know the secret number.
    Verifier: Oh yeah? Well, what's the remainder when you divide the
           secret number by 1958?
    Prover: It's 22.
    Verifier: OK, I'm 95% sure you know the secret number. Now,
           what's the remainder when you divide the secret number
              by 111?
    Prover: It's 105.
    Verifier: OK, I'm 99.99% sure you know the secret number. That's
           good enough, so you can log in now.

The next time, the verifier will use different divisors so that anyone
who knows these two won't have any useful information.

In practice, the questions are a bit more complicated, and there are rules
to use in forming the number and the questions so that no information that
would be valuable to a system cracker will be communicated.

How about looking at it the way UK authorities do: they make a distinction
between encoding a signal to facilitate transmission and encrypting a
signal to prevent others from reading it.

In the first category comes things like the scramblers used on G3RUH/K9NG
modems (and others no doubt), using PKZIP to compress a file so it takes
less bandwidth, 7plus and UUcode etc. The fact that most of these make it
difficult for someone else to read the contents is purely coincidental......

Even ASCII is a code........

Dave

It would seem to me that a sensible solution to the digital
hierarchy problem would be for someone to start the voting process for
groups like:

rec.radio.amateur.digital.packet
rec.radio.amateur.digital.tcpip
rec.radio.amateur.digital.rtty
rec.radio.amateur.digital.pactor
rec.radio.amateur.digital.equipment

etc...

This is the logical hierarchy, and most probably the reason that
rec.radio.amateur.digital.misc won the vote. This is similar to when
the rec.ham-radio hierarchy was changed to rec.radio.amateur. It will
make more sense in the long run. All that is necessary is for the rest
of the newsgroups to get created.

I'm looking for additional applications that will run with a BPQ Switch on
my PC. (I already run a BBS.)

Specifically, I'm looking for something that could be used to provide help
and information text files to users, without them having to connect with
the BBS.

Perhaps there are fileserver or database applications that might be
useable for this?

Thanks!

73, Andy

 I would like to know how much a basic packet setup would cost. Exclude the computer, which I have access to, but include a transmitter (HF preferably) and all other stuff.

 Thanks in advance for any assistance.

Beaconing, under most circumstances, is a waste of time.

> *) When is using an ID is appropriate and how often?
>   *) Is more often than what the FCC requires for a
>   CW ID a good idea or a bad idea?

If you use your call as your AX.25 address, then you'll identify om

every frame. If you use some alias for MYCALL, then you'll need to
beacon once every ten minutes with your call.

You are no longer required to identify using CW. Identifying in
CW wastes time and serves no purpose.

: on proper etiquette for the packet waves. ...

:   *) How often and when to beacon?

A number of years ago, out club set up a digipeater on 145.03 MHz.
The reason we picked that frequency was that it was almost unused at
that time. We were trying to move some of the heavy congestion from
145.01 and other heavily-used channels.

In order to try to get some action started, I set my TNC to beacon
once every **15 MINUTES** with a short message giving the digipeater's
location and power.

Well, it turned out that 145.03 was a busy frequency over in Sacramento,
which was within range of my mountaintop location. I got a large
number of flames, both on the air and by telephone, about my cluttering
up the airwaves with my beacons. Gosh, it was one 3-second transmission
every 15 minutes. I hadn't thought anyone would object.

So take fair warning. "Beacon" is a dirty word among some packeteers.

> What is the situation for US Hams wanting to operate PACKET in Europe (esp
> UK, France, Germany) ?
>
>
For the UK you just need to get a reciprocal licence and operate pretty much
as normal. UK packet BBS all have GB7+3 calls, with nodes being either
GB7+2 or under personal callsigns. Frequencies in use are 144.625, 144.650
and 144.675 on 2M, with 432.625, 432.650, 432.675, 433.625, 433.650 and
433.675 on 70cms. Exact usage of those frequencies varies from area to area so
you might find that a particular freq is quiet in some places.

As far as rules go, you can use your TNC with your US call in it, provided
you ID in packet every 15 mins with the full call and a CWID every 30 mins.
Note that sending adverts is illegal in the UK and BBS sysops take a dim view
of it!

I have uploaded to WSMR-SIMTEL20.Army.Mil and OAK.Oakland.Edu:

pd1:<msdos.ka9q-tcpip>
PCELM31.ZIP   Mail user agent for KA9Q NOS, UUPC or Waffle

PCElm version 3.1 by Wolfgang Siebeck and Martin Freiss is a mail user
agent (UA) with a user interface closely modeled after the USENET ELM.
To avoid confusion, we would like to mention that PCElm and USENET ELM
are *not* related.

PCElm is intended to be used as a drop-in replacement for BM when using
the KA9Q NOS package or as a replacement for mail.exe when using UUPC.
It can also be used for other mailsystems, as all relevant things for
compatibility with MTA's (Message Transfer Agents) are configurable.

PCElm has a nice user interface, with easy to learn and easy to use
commands. UN*X users will already be familiar with the more important
commands. It can be made to work with just about every mail system
there is for PC's, as PCElm makes no assumptions at all about the
underlying network software. Finally, PCElm is multilingual; you can
make all messages appear in your favorite language. Message files
for English, German, Spanish and Dutch currently exist.

This new release fixes all known bugs in release 3.01 and adds some
new features, the most promiment of which is some knowledge about
MIME (multimedia mail).

Uploaded by the co-author.

Martin

Well, a ham operator in town once kicked his packet radio up to full power
while doing a file transfer to a Packet BBS. The only problem is that he's
practically neighbors with the BBS, and he was desensing its receiver. The
Sysop solved the problem, but kicking his power up to desense back....

I find 0.5 W to be adequate for packet shooting across town....if I can't
work at 0.5W, then I can't work it at all....is what I find, at least with
the packet BBS (works good with the higher antenna, never works with
the lower antenna.....the Digi is located out of town (on a ridge), and I can
work that at the same power.

> *) Has the FCC busted anyone who was using packet?

I heard about an operator in Canada getting his wrist slapped by the DOC, for
inappropriate message content in a packet message...

What is the new X1J package going to do for us? I know you said it was in beta mode but it would be nice to get an advance glimpse at the new features or fixes that will (or may be) included. There was also a hint that the ACL stuff might be deleted in the release notes for X1H. I would be curious to know if we are going to suffer this act of regression....

Good morning. It's Sunday the 25th of July and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The RSGB's featured once again on the BBC; the 1994 RSGB President has been elected; and the North Devon UHF repeater is off the air.

The RSGB has once again been in the forefront of publicising amateur radio in the media. Broadcast last night on the BBC World Service was a programme called Waveguide which featured amateur radio and the RSGB's role in the hobby for the past eighty years.

The Council of the RSGB has elected Ian Suart, GM4AUP, President for 1994. Ian is well known for his work as Zonal Council Member for Scotland, and his Chairmanship of the Data Communications Committee.

GB3ND, the North Devon seventy centimetre voice repeater on RB14 is currently off the air and will be out of service until the NTL engineering work on the site is completed. The North Devon Repeater Group apologises for any inconvenience caused and will keep users informed of developments via GB2RS. For further information contact the repeater group secretary G3PGA whose address is correct in the RSGB Call Book.

The RSGB has announced details of this year's elections to the Society's Council, and for the RSGB liaison Officer scheme. Full information appears in the August edition of Radio Communication which is being sent to all members this week.

Due to unforeseen circumstances the venue for the Torbay Mobile Rally, scheduled for Sunday the 29th of August, has been changed from that advertised. The new venue is the Audley Park School, Barton Road, Torquay. Further details from G3HTX on 0803 526762.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Tuvalu, WB6RZK will sign T26RF from Wednesday the 28th until Tuesday the 3rd of August. From Liechtenstein, DL5DCM and DL6DCM will sign HB0/own call from tomorrow the 26th until the Friday the 30th of July on SSB only. From Hong Kong, G0TBI will be active as VR2/G0TBI from Friday the 30th of July for 14 days. Check CW frequencies 14,017 and 21,017kHz and SSB frequencies 14,245 and 21,245kHz, all plus or minus QRM.

We know of five rallies taking place today Sunday the 25th:

The Colchester Radio & Computing Rally is being held at the St Helena School, Sheepen Road, Colchester, which is adjacent to the Colchester inner by-pass,

Avenue of Remembrance. The venue is signposted from the A12. Doors open at 10am and there is easy access for wheelchairs and ample car parking space. There will be trade stands catering for radio and computer needs as well as components suppliers. The event also features an amateur radio car boot sale and a bring & buy stall. Morse test will be available on demand, but candidates should remember to bring two passport-type photographs. Talk-in will be on channel S22.

The Norfolk Amateur Radio Club and Hewett School Radio and Electronics Group Rally is being held at Hewett School, Norwich. Doors open at 10.00am. There are trade stands and a bring & buy stall plus various displays. The venue is described as suitable for all the family.

The East Yorkshire Radio Rally is being held at the Beverley Racecourse, North Humberside. Doors open at 11.00am, or 10.45 for disabled visitors. The rally features trade and special interest group stands and a bring and buy stall. There will be model aircraft displays through out the afternoon. The organisers regret that unforeseen problems have prevented the running of Morse tests at this event. The revised schedule is now: at 12 noon the East Yorks Repeater Group will give a lecture, then at 1.30pm there will be a lecture by the East Yorkshire Packet support group. At 3.00pm the RSGB RLO and General meeting takes place. Talk-in is on channel S22 via GB4EYR.

The Radio Amateurs Invalid and Blind Club's Annual Romsey Picnic is being held at the Broadlands, Romsey, Hampshire. The event features the usual attractions, plus a junk sale, a bring & buy stall, refreshments and a grand draw. All members, families, friends and supporters are welcome. Talk-in will be on channel S22.

The Rugby Amateur Transmitting Society fifth Annual Rugby Radio Rally is being held at the BP Truckstop on the A5, some 2 miles North from junction 18 of the M1 motorway. Traders and visitors are welcome from 8.00am. The truckstop will be open for catering and other facilities throughout the day. Talk-in will be on channel S22 by GB5RRR.

We have been notified of only one rally for Sunday the 1st of August:

The McMichael Rally and Car Boot Sale is to be held at the Haymill Youth and Community Centre, Burnham Lane, Slough. The Centre is near the Burnham railway station. Starts at 10.30am. Talk-in will be on channel S22. Details from Neil, G0SVN or Roy, G4XYN tel: 0628 25952. This rally was originally scheduled for the 18th of July.

HF contest news now:

The first ever Islands on the Air SSB Contest started yesterday Saturday the 24th and finishes today Sunday at 1200GMT on 3.5 to 28MHz. See March RadCom page 81 for full details. The RSGB RoPoCo-2 Contest will take place next Sunday, the 1st of August from 0700 to 0900GMT between 3520 and 3570kHz CW only. See February RadCom page 66 for contest exchange information.

VHF contest news:

The RSGB 432MHz Low Power Contest is taking place today Sunday the 25th from 0800 to 1400GMT. It features four entry sections: single operator fixed, single operator portable, all others and short wave listener. February RadCom on page 66 has further details of this event. The RSGB's 2nd 432MHz Fixed Contest is scheduled for Sunday the 22nd of August. See February RadCom page 67 for further details.

A special event callsign to look out for this week is GB0PG. This is the Pinkneys Green Scout Group from Maidenhead, Berkshire operating during the Groups Annual Camp at Tregate Castle in Monmouth from Saturday the 24th of July for one week. Guests of the group at the camp will be 30 Hungarian Scouts and Leaders. This is part of a two-year project which aims to assist in the redevelopment of Scouting in Hungary and to encourage international friendship through Scouting and Amateur Radio. The Pinkneys Green Scouts, who have raised over 10,000 in eight months to support the project, will travel back to Szombathely {pronounced Sombatey} Hungary in 1994. The operators of GB0PG are Peter and David Roberts, G0JPE and G1BPV respectively. Operating frequencies are 3,740, 7,090, 14,290, 21,360, 24,960 and 28,990kHz as well as 2m and 70cm FM and SSB. Contacts with any station are welcomed, especially so, if connected with Scouting or with Hungary.

And here is the solar factual data

For the period from the 12th to the 17th of July, with the quiet side of the sun looking our way, solar activity has been low. Nothing of any note has been reported. We are short of Meuden data this week so most is USAF/NOAA data. No flares have been reported. The sunspot count has meaned about the 90s. Solar flux levels tended to increase slightly from 86 units on the 12th up to 100 units by the 18th, with the period averaging 91 units. Geomagnetic activity has declined with the period becoming quiet by the 14th with the Ap indices dropping to only 2 units. The period averaged 6 units; the state has been 'nil nothing to report'. We do not have all the radio quality index data to hand, but what we do have indicates that on the 13th to the 15th of July levels were normal, with all circuits being much the same. The aa indices are not to hand this week. The X-ray flux recovered from only A5.3 units on the 12th up to B1.3 by the 18th with the period averaging B1.0 units. The smoothed monthly values for December 1992 are: Spots RI 73.2; flux 127.3; magnetic Ap 16.2. Bartell rotation 2158 begins on the 21st of July.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, are also incomplete this week. For the 12th to the 15th of July the daily highs average 7.5MHz and the darkness hour lows 4.1MHz. The 15th was marked by seven hours of blanketing Sporadic E.

Now the ionospheric data for the north:

Again we have limited data. For the period 12th to the 15th of July the F2 daytime critical frequencies at Ekaterinberg averaged 6.2MHz and the darkness lows 4.8MHz. Cycle 22 has caught out the forecasters on a number of occasions, so for what it is worth the latest forecast for spot minimum is May 1996 with a smoothed count of about 6, but in fact the cycle is declining very quickly

and could well finish ahead of the forecast.

And lastly the solar forecast:

This week the more active side of the sun will be coming into view. Solar flux levels are expected to be about 100. Geomagnetic activity could be unsettled due to the passage of a coronal hole. Ionospheric levels based on the radio quality indices are expected to be normal at first then declining as the week goes by.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T X and G7 O Y series, and Novice calls in the 2 0 A G and 2 1 C C series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Has anyone with access to the source looked at putting a version
of X1? on the DR200?? It seems that the dual port box would
make a great IP gateway between a local LAN and a backbone.

Greetings all.

I am trying to set up PPP between two machines (using a serial line).
The information on PPP in the 'manual' is very esoteric, and I am
unsure of what I should be doing. I can get them both to start
listening for a connect, but damned if I can actually get them to talk
to each other... The serial line dosen't have to have carrier does it?

Is there anywhere (books, online information, etc) that I can get more
information about PPP (apart from the Morning Star presentation, or
the RFC dox, both of which I have read)?

This would be much appreciated!

Richard

Is there an easy way to identify bad AA NiCad batteries?
(something that doesn't require any circuits other than a voltmeter?)

Very challenging... I was trying exactly this, but didn't have any luck,
until...

>Is there anywhere (books, online information, etc) that I can get more
>information about PPP (apart from the Morning Star presentation, or
>the RFC dox, both of which I have read)?

However, the docs from PA0GRI, dated 29 Dec 91 have a little example of how
an autoexec.nos for ppp should look. Here's the relevant bits, you can find
the whole doc on ucsd.edu:/hamradio/packet/tcpip/pa0gri (I think, memory's
a little rusty). The file is called nos_1229.lp.

)
) This implementation of PPP is designed to be as complete as possible.
) Because of this, the number of options can be rather daunting. However, a
) typical PPP configuration might include the following commands:
)
)
)
)
)   - 34 -
)
)   attach asy 0x3f8 4 ppp pp0 4096 1500 9600
)   dial pp0 30 <hostid> 3 dialer.pp0
)   #
)   ppp pp0 lcp local accm 0
)   ppp pp0 lcp local compress address on
)   ppp pp0 lcp local compress protocol on
)   ppp pp0 lcp local magic on
)   ppp pp0 lcp open active
)   #

```
)         ppp pp0 ipcp local compress tcp 16 1
)         ppp pp0 ipcp open active
)         #
)         route add default pp0
```

I haven't actually tried this yet, but it's mostly because the SLIP line
that I'm using now has quite a lot of traffic.

Not with just a volts-guesser. However, if you have access
to an accurate chart recorder and a load resistor, you can
perform a very accurate test. The idea is to duplicate the
discharge curve one finds in the battery data sheet.

The ritual:
1. Charge the cell any way you think will give a full charge
for a known amount of time. Also do this to a known good cell.
2. Connect a chart recorder, data logger, DVM and stopwatch,
or whatever across the cell. Also connect a load resistor.

For the generic AA 500ma-hr cell, I use a 2.7ohm 2 watt resistor.

The recorder will start at about 1.35v and then show almost a
constant voltage of 1.20 volts for about 45 min. It will
then drop very rapidly. The energy capacity of the battery
is the area under the curve. A dead or sick battery will fall
off more rapidly and will not yield a fairly constant voltage.

Repeat the ritual with other AA cells. You should get curves
fairly close to the known good cell. Try to keep the initial
charging time constant from cell to cell. Also, try not to
wait too long after charging before testing as self-discharge
may affect the outcome. At 45C (113F) a new pocket cell NiCad
will normally lose 50% of its capacity in 30 days.

The ACL command is still there on my local beta-test node..... A most useful
facility!

This is an extract from the into.txt file with the beta-release:

>   INTRODUCING TheNet X-1J
>
>TheNet X-1J extends TheNet X-1H with a number of additions as detailed
>below. The main change, however, is support for a simple deviation meter
>that shows each station's deviation in kilohertz in the heard list, by
>measuring the receive audio level with an A-D converter at the end of each
>packet.
>
>The other changes are : Control of slime trails; The information text in RAM
>has been doubled in size; The info, ctext and btext messages may be multiple
>lines; Nodes broadcasts occur 60 seconds after power up; Optional reconnect
>to the node following remote disconnect; PARMS, MODE etc parameters may be
>changed by specifying parameter number and value; Digi up and downlinks may
>be selectively en/disabled; Level 4 retries (min) has been reduced to 1

>and an MTU command has been introduced to set MTU data. The handling of
>node aliases may be made case sensitive and TALK may be configured to pass 8
>bit data.
>
>TheNet X-1H did not extend the functionality of X-1G, but fixed 3 bugs. In
>addition, the ARP digi bug patch released earlier this year has been
>included in X-1J.

It also fixes some interesting little 'features' in X1H - try a ping of length
19 or 20 to an X1H node......

DC.SB SAT @ AMSAT $ANS-205.01
.DOVE RECOVERY EFFORTS STARTED

DC.HR AMSAT NEWS SERVICE BULLETIN 205.01 FROM AMSAT HQ
.SILVER SPRING, MD JULY 24, 1993
.TO ALL RADIO AMATEURS BT
.BID: $ANS-205.01

DC.DOVE-OSCAR-17 (DO-17) Recovery Efforts Started This Week!

DC.DOVE ground station control operator Jim White (WD0E) accomplished a major
.first step in the recovery of DOVE-OSCAR-17 (DO-17). With the assistance
.of Bill McCaa (K0RZ) thirty miles away, WD0E was able to send commands and
.listen to the results using an phone-patch between him and K0RZ. K0RZ's
.station, using a 4 ft diameter Mode-S dish and a NIR-10 DSP unit, was the
.S-Band "ears" for WD0E. Using K0RZ's excellent S-Band set up, WD0E was
.able to send commands and listen to DOVE's reponses quite clearly. The

.first command that WD0E sent was what he refers to as the "fire-code."
.This immediately reset DOVE's on-board computer to its most basic operating
.system software known as MBL. MBL is stored in DOVE's computer in Read
.Only Memory (ROM) chips. After having verified that the computer had re-
.set, WD0E then sent several commands to turn-on and then off the S-Band
.transmitter to be sure that the Telemetry and Command (T&C) system was
.functioning. After having confidence that DOVE was hearing the commands
.and reponding correctly, WD0E then commanded DOVE to send 30 frames of
.telemetry on its 2M downlink frequency of 145.825 MHz. While the 30 frames
.of telemetry was being sent, K0RZ was simultaneously recording and decoding
.it. WD0E points out that the major significance of this first step was
.that it assured him that DOVE's primary systems were still in good shape
.and that the receivers and transmitters were working normally along with
.the T&C system. From this point onward, Harold Price (NK6K) will proceed
.to reload the "house-keeping" software. If necessary, K0RZ has volunteered
.his station to assist in the DOVE "house-keeping" software reload oper-
.ation. With this sucessful first step, WD0E is very optimistic that DOVE
.can not only be restored to full operation, but it can be made to "speak"
.and perform its primary mission of education. Please stay tuned to the
.AMSAT News Service (ANS) bulletins for further updates on the status of the
.DOVE recovery effort.

Jim

If anyone would like to assist in the way of equipment to
set up a packet private station in Havana the primary item

needed is a simple computer that will do the job plus act as
a BBS for land line ect.

This project could be a reality within a few weeks.

Call me anytime on 613 592 1401

Anyone know of an archive site for this newsgroup? An FTP site would be
preferable, but a mail server is OK.

Hello there.

   I wonder if anyone has used any of these modems:
        BayCom
   or
        BayPac
   for software-based TNC's?

   Your comments on their performance will be appreciated.
   I would specially like to know about their KISS mode capabilitis and
   baud rate limits.

Hi,

I was just wondering if there is anyone out there who knows of a program to
capture the packets generated from a packet driver. In particular I have a
slip driver and I want to capture all the data that the driver is sending to
the serial port, with all headers, framing bits, etc. Is there a pre-existing
program that will do this?

Thanks for any help that you can provide

Subject: Popularity of various PR NOS's
To: packet-radio@ucsd.edu

Can anyone post information on the relative popularity
of the various systems being used in amateur packet radio?

ARRL's "Your Gateway to Packet Radio" lists several including:
digipeaters, NET/ROM, KA-Node, TexNet, and TCP/IP. To me, TCP/IP
seems the obvious choice, but is it? What's really happening
out there? My copy of "Gateway" dates from 1989. Probably lots
of water over the dam since then :-). What's happening
currently?

Thanks,
jim

There have been a few messages recently about how to make a 6-meter
handheld, given that the commercial choices are either expensive or less
than wonderful. Assuming that the Ramsey 6-meter transceiver is the same
size as the 2-meter, do you think it would be possible to make a 6-meter
HT from a Ramsey kit? Is it small enough and durable enough?

What kind of equipment is needed to build & tune a Ramsey 146? Basically, is this a kit you can solder together and go, or do yuo need an oscilliscope, freq meter, swr meter, etc to have it working right? I was thinking of building it and listening while I work on my license, then using the xmit side. Good idea, or should I go commercial for a first rig? Also, how does it work with packet?

Thanks for the pointers,

dave.

>
>What kind of equipment is needed to build & tune a Ramsey 146? Basically,

That's the 2m receiver isn't it? I built one last weekend, and it went pretty well. (BTW, I have years of experience in digital electronics, but this was my first VHF radio, and my first alignment job).

>is this a kit you can solder together and go, or do yuo need an

Not bad to assemble. 3 chips (NE602 (1st mixer/osc) , MC3359 (2nd mixer/osc/IF strip), LM386 (Audio amp)), 4 transistors (RF amp, 1st IF amp, AFC, stabiliser), and about 60 passives. Varactor tuning.

>oscilliscope, freq meter, swr meter, etc to have it working right? I was

Well, you certainly don't need an SWR meter for a receiver. The frequency counter (if it covers 10.7Mhz higher than the desired frequency i.e. 154.7 MHz) would be useful to set up the 1st osc (This is a dual superhet design, the 1st osc beats the signal down to 10.7Mhz, and then the 2nd to 455kHz). The second Osc is a xtal, and both IFs are ceramic filters, so there is no alignment there. I used my 'scope (Tekky 555 with 1S1 plug-in) which has a 1GHz sampling input, but I didn't really need it.

The instructions suggest finding a local Ham to transmit a test signal to you and then tuning to receive it. That would work. Simply tuning the coil until you hear the local repeater (or digipeater) works also.

>thinking of building it and listening while I work on my license, then

I have my license, but no equipment. I think this should be a good start for repeater/packet working.

>using the xmit side. Good idea, or should I go commercial for a first rig?
> Also, how does it work with packet?

Not tried it yet, but I can certainly hear the local digipeater. I need a better aerial (I have a couple of bits of wire as a dipole) before I have any hope of decoding it, but it sounds possible

I think commercial equipment is outside the spirit of amateur radio. I'm going to home-brew everything!.

A friend of mine is looking for an easy to use, cheap, TNC.
Some friends of mine have the KPC3 and really like it.

I'd like to see what others on the net have so say about the unit.

Thanks much.

I will try to summarize the responses (if I get enough).

Is AX25 impossible? I wonder. My understanding (doubtless flawed) is
that AX25 as implemented in TNCs resembles Ethernet more or less. But there
are some major differences. When you transmit, you don't get any real-time
indication if you're "doubling" with another transmitter. You just wait
a probabilistic time period after receiving the last packet before you
try to send yours. The other big difference is that there is no guarantee
that you can hear all the stations on channel. The guy you're connected
to may be Q5 for you, but you may be Q3 against some 3rd party who is Q5
to him. I.e., the third party will degrade your throughput even though
you can't hear him/her. All this is very noticeable here in CT, where
lots of us "users" are in valleys talking to repeaters or switches at
hill top locations. (This is also one reason why HF packet is so awful.)

So, I think the "collision sense - multi access" model isn't very optimal.
We should get much better throughput if first class mountain-top people
were able to do time division and give time slots to us second class slobs
in the valleys. (Of course, even first-class locations will experience
the third party problem over longer ranges.)

Has anyone tried anything along these lines? Are there
commercial/scientific networking regimes similar to this? There is a
crude feature in the tcp/ip world using ICMP to tell you to "shut up
for a while", but we could do better than that!

Idly yours,

That's CARRIER sense, multiple access. The CD, collision detection,
mode of ethernet isn't possible in a simplex system. However, many
of us have recognized this fault, a media problem, and have gone
to duplex repeaters instead of digipeaters to solve it. The hidden
terminal problem goes away because now you hear everything the
repeater hears in real time. And, if you operate your station in
full duplex as well, you can even implement CD.

Slotted protocols have other horrible problems, like dealing with
stations attempting to join the net, or stations that drop off
the net unexpectedly. And their thruput is less than half that
of the duplex repeater due to the time consumed by the slotting
beacons and the simplex nature of the media.

Gary

Hi folks.
This issue about the impossibility of packet reminds me of the DAMA protocol
that as far as I know as good as completely removes the collision problem.
There is a software called TheNetNode available that holds the master algorithm
for this protocol. Is there anybody out there who has used this software or does
anyone know if it is as good as it is claimed. Can it be used with F6FBB BBS
software, and where can it be found???

Has anyone actually implemented CD that way? I'd love to get in
touch with anyone who has and who would be willing to write it up
for QEX or the Digital Conference Proceedings.

[a lot about packet radio collision detection and related stuff.]

I don't know how widespread this is in the USA, but in Germany there is an additional protocol that some (though not all) digipeaters do, called DAMA. I don't actually know what DAMA is the abbreviation for, but it works the way, that there is one 'master', i. e. the Digipeater, that tells all the other stations, that are connected to it, when to send. This asking is always done in subsequent order. If one stations does not have anything to transmit at one moment, it tells the DAMA master so, and after a few 'idle' rounds, it is only asked every second, third, fourth, etc. round, until it has something to transmit again. This also gives a chance to weak stations, to get their packets through and makes different baud rates possible at the same frequency simultaneously.

In my vicinity there are two difipeaters that are in reach for my 5wtts handy and 2band groundplane. One makes DAMA protocol, whereas the other doesn't. Even if there are only two (stronger) stations at the non-DAMA digipeater, I cann hardly establish a stable connection, whereas on the DAMA digipeater there may be more than 8 (possibly weak) stations connected simultaneously.

Since nearly all TNCs can do DAMA nowadays, it works excellent. There is no more need for high power stations to 'flaten' the weaker ones, since if they don't listen to the DAMA requests (or use an appropriate frack time, if their modem is not yet capable of DAMA), they won't be heard.

I would like to know how widespread this protocol is in the USA.

Especially at times, when packet gets somewhat crowded, I use the DAMA gate, though it takes me a few 'hops' from there to my home BBS, which has only a non-DAMA digipeater.

Hope for any responses,
Bernd, dg6yhi

I notice these are going "cheap" these days. I have been debating
getting one for both voice and packet operation

In calling around for prices I see that Alinco are now sending them out
of the factory "9600 baud" modified for $50. I presume this is more
than just wiring a socket to modulate the VCO directly and get the
audio directly out of the detector. Have they widened the audio chain?
Do they put a different filter in the IF? Is it worth it?

Do they do they remove the silly IF strip back to back diodes in the
currently shipping model.

Anyone having bad intermod problems with this rig? I live in a pretty
hot RF environment.

>Please don't post the code yet - it needs changes.

I have tracked down a local DR200 occupying shelf space so I will have a go
at it when the source arrives.

For those who have asked for the beta-test version, note his last comment!

Dave

Hi folks,
I am running FBB and paKet. Is there a Server available for FBB where a
YAPP download can be posted to a Private File Area, which can be viewed
by the SysOp only, and then posted to FBB/YAPP for general uploading.
This facility is available with paKet.

I use a Baycom Modem, with the TFPCX driver, and the F6FBB BBS Software as
a PMS, runns 20 channels in theory, I have had it up to 5 simultaneous user
connections, and 3 forwarding sessions though...

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to
add the groups created during the latest reorganization vote and the
description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.

The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew,

.antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers

of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Seems I overlooked an alternative that someone was kind enough to point
out in mail to me: we could also create an 'alt' group for packet radio
and gateway the mailing list there.

This would work, of course, but it wouldn't have a good a propagation
as a more mainstream 'rec' group would have.

brian@nothing.ucsd.edu (Brian Kantor) writes:
>Yup, at three years, you're a newbie. You've only been around Usenet
>since the farcical "voting" process got popular. You seem confused
>about the power and effect the votes have.

Oh, I see... }:-)

Since you called us all newbies in your first message on this subject, I'm going to have fun deflating your flame... piece by piece.

I have been using UseNet since 1985 (8 years.) I am not a newbie. Many others to whom you aim your statements have been on the Net at least as long. You've only heard of me and many of the others for three years because that's how long you've been complaining about the FAQs we post. That's about how long most FAQs have been around.

OK, one point of yours has been shot down.

>Please do try to remember: Usenet is *NOT* a democracy. The votes
>are ADVISORY to the administrators of the news systems; there is NO
>compulsion for any administrator to follow the result of any such
>result when he believes that to be wrong or against his best interests. [...]

Hmmm... You seem to imply none of us knew how UseNet admins fit into the picture. Allow me to establish some credentials in this category since it seems that you assume people have no experience when you haven't heard of it.

I've been pretty closely observing how news administration is done since it arrived at the univerity I attended. I've been involved in news admin work as an aside from my software development duties ever since starting at Amdahl over 3 years ago. I was the leader of the team that set up the amdahl.com firewall and news/mail/uucp hub machine on an Amdahl 7300 Unix mainframe. So you're not the only one on the block who can see what news looks like on a big system.

Besides, it doesn't take as long as you seem to think for anyone to figure out that the news admin sets the policy on local newsgroup creation and retention. But don't get the idea that there's any single way to do it either - many don't have time to follow news.groups. They'll do whatever they please within the limits of their time, disk space, and management.

We know that. Now you know we know it. Another point shot down.

>You admit that the "voting guidelines" are only that, and that they
>weren't equal to the survey that you needed to make, yet you somehow
>feel you needed to follow them and to follow their inappropriate result.

What wasn't equal and how's that significant. Surveys and discussion were conducted for a month before the 30-day discussion. So that's more time than most newsgroups get.

Also, is the result "inappropriate" just because you don't like it? Only at your site. Not necessarily on the rest of UseNet, as you imply.

Yet another point shot down.

>And you were told that the tcp people (as surveyed in the tcp mailing
>list) didn't a newsgroups, yet you went ahead with the proposal, and

>express surprise at the negative result!

All inputs were considered, including but not limited to yours. No one will apologize if that disappoints you. The transcripts of that discussion and the news.groups discussion are *still* available by ftp if you want to see what people thought were the pros and cons on that point.

The proposal evolved as more inputs were made. The digital radio groups received strong support from the packet radio community, expect for your single opposing view. The rest of the opposing views were withdrawn whenever anyone mentioned that the packet community appeared to favor it.

Based on the available information, there is little doubt that it was correct to put it up for a vote and accept the outcome. That was done. You should accept the part that passed, rec.radio.amateur.digital.misc, because there is no other opinion poll which can supersede the vote.

>Remember that good intentions often pave the path into hell.

Oh my... what could you possibly mean by that?! }:-) (The horns on that smiley seem particularly appropriate to poke fun at that one! heh heh...)

>I've asked the people on the packet-radio mailing list what they want
>me to do. If there is some consensus and it seems reasonable, that's what
>I'll do. I am more interested in the fate of the mailing lists than
>of the Usenet newsgroups; the mailing lists have always been of more
>benefit, interest, and importance to me.

Ah ha! Now we get to the bottom of the matter... (!!!)

Yes, Brian. You have made everyone repeatedly aware that the UCSD mail lists are the most, if not only, important things in your view of UseNet.

You have opposed everything that is different from how UseNet was 5 or more years ago. Open your eyes - the 90's have arrived (years ago.) Things are changing. Are you going to adapt or just keep complaining?

Some things just have to change because of the increasing traffic on UseNet and the Internet. For example, you have vocally opposed the FAQs, claiming they are a waste of bandwidth. Yet many more people have said they appreciate them than all of your complaints combined. Maybe you didn't notice the trend a few years ago to make this kind of information available on UseNet where people are already looking for it. The trend continues because a lot of people think it works.

Honestly, it looks like you're always trying to be a thorn in the side of anyone who's trying to participate in the volunteer postings on the rec.radio.amateur newsgroups. I would not be disappointed if you decided to *disconnect* all your mail lists from the newsgroups. You're behind the times and you appear unwilling to try to catch up.

Frankly, I'm tired of hearing your repetitive whining, Brian. I've tried to work with you. I've tried to be polite... I've been patient. Those clearly

won't work. You need not expect those any more until you show some
flexibility.

It can't work any less than the previous approach did. It's soooooooooooo
frustrating to try to work with you.

>No need to worry about
>Usenet - it will survive anything even well-meaning people can do to it.

I know you're aiming that at Paul, me, and others. Are you including
yourself in that? If so, I agree completely. If not (as your tone implies),
I suggest you remember that there's more to the world, and UseNet, than any
single person's view of it.

I have found the TAPR-II ROM images on various ftp sites, but is
there anywhere either a schematic or set of circuit specs for
the hardware?

Here's what I know:

2 MHz Z-80
32K ROM in the bottom half of the memory map
32K RAM in the top half (battery backed)
1 Z-80 SSC, port A the asynchronous host port, port B to the modem.
Port B DTR is the transmitter key, port B DCD is the modem carrier
detect. Two of the other pins are used for CON and STA, but I don't
know which off hand. Nor do I know if it matters where in particular
the SSC goes (though I dimly remember that it doesn't, since it is
aparently the only thing in I/O space). The transmit and receive
clocks on the SSC go to a baud rate divider.

Is there anything more to it? Must anything funky be done to the
circuitry or the ROM if the CPU turns out to be faster than 2 MHz?

I seem to dimly remember something about the ROM figuring out on
its own what the clock rate is (for the purposes of the real-time
clock).

How far off am I?

Brian will correct me if I'm wrong ;-) but I don't believe he was refering to
how long anyone was on USENET when he used the term "newbie".

The schematics, manual, prom images, and a blank board are available
from TAPR for like $30. I have built several of these, leaving out
the 1200 bps modem part of the board, as 9600 bps network nodes. If
you have to buy all the parts, it's about $40 to complete the board.
Much less if you have a good junkbox; the parts are common.

Greetings,
In case a few of you missed it, the August '93 issue of 73 Magazine
is featuring an anthology of 73 packet radio articles from 1983 to 1993
by Charles Washington WA1RZW, along with a low cost FM packet deviation meter,
a review of PC Pakratt for Windows and the AEA PK-900, and ETC!

1.5 KW Gasoline Powered 16 to 36 volt DC Generator for sale

I have several military surplus cage mounted DC generators that have
been refurbished and are offered for sale. The units have a manually
variable voltage output of about 16 to 36 volts at up to 57 Amps
continuous (approximately 100 Amps intermediate) operation. These
generators were originally designed to power military radio transmitters
under extreme conditions or "jump start" large diesel engines in trucks
and tanks.
The generators are powered by a heavy duty two (2) cylinder air
cooled industrial (Wisconsin) engine of 16 cubic inches and produce about
10 horsepower using ANY type of gasoline. The engines have a protected
ignition system designed to start and run under the worst weather
conditions. The engines are quite capable of powering a standard 5 KW
120/240 volt 60 Hz generator instead of the 28 volt DC generator.
The military engines are easy to maintain and operate and come
equipped with a mechanical fuel pump allowing gasoline to be drawn from
the integral 1.5 gallon tank or an auxiliary fuel tank. Repair parts are
available at any auto supply outlet or outboard motor supply business.
These generators were designed to be "GI proof" and have been maintained
and rebuilt to the same standards as when originally put into operation.

Possible uses are:

Running transmitters and repeater communication systems.
Charging 24 volt trolling motor batteries.
Charging 36 volt fork lift batteries.
Jump starting diesel engines at truck stops or fixed sites.
Powering 24 volt to 120 volt 60 Hz inverters as found in RV's.
The engines have been used on large "mudboats" in Louisiana marshes.

Original cost to the US Government: $2610.00

Sale Price: $300 each FOB Baton Rouge, LA.

Weight: 121 pounds each

>I have found the TAPR-II ROM images on various ftp sites, but is
>there anywhere either a schematic or set of circuit specs for
>the hardware?

The complete manual set (updated for version 1.1.8a firmware) is
available from the TAPR file server (sorry, no electronic version
of the schematic).

Send an e-mail message to:

file-request@tapr.org

Include in the message the commands

get /pub/tapr/tnc2doc.zip
quit

The file will be uuencoded and sent to you. The firmware and many
other helpful files are also available. The commands HELP and DIR
(on separate lines, before QUIT) give additional information on
the file server.

>but that's wasteful of spectrum.

As you say, an inactive station can be aged out by reducing its polling rate to well below one poll per round. Similarly, the polling slot for 'new stations' can be provided at a very low rate - it's a trade off of latency against efficiency.

>if care is not taken. With CSMA, these problems don't exist. However,

Agreed, though I think that the disadvantages of contentious simplex operation are so bad that they're not worth having purely for their resistance to failure - better to use redundant repeaters / hubs for that !

If you're referring to the "Poor Man's Packet, a complete
software TNC for PC compatibles!" (by Kevin Feeney W2EMS and
Andy Payne N8KEI), then you would want th August 1991 issue
of 73 Magazine starting on Page 8.
(My message in # 228 makes mention of the August 1993 issue
which has details on getting back issues & reprints.)
Otherwise, I defer to the ever-growing host of network packeteers,
who will, now doubt, straighten us both out.
I'm getting too old to keep all the titles & buzz-words straight!
(By the way, I do not now, nor have I ever worked for 73 Magazine;
 I just purchase it for the Wayne Green editorials!) 8<))

Dear TCP-Group and Packet Radio Group Members,

My name is Ned Bade, I work for the Cornell International Institute for
Food Agriculture and Development (CIIFAD) at Cornell University, and I am
helping CIIFAD design an academic email network in the Philippines. We are
considering using ka9q NOS as an IP mail router for a network that will be
both telephone and packet-based. We have started to tap into some local
expertise here at Cornell, but I have some general questions I would like
to place to peoples' expertise on the net. The network would need to

support between 50-100 people initially, and I suspect that number could grow to 250-1000 in 3-5 years. You can resond to me personally at: eb15@cornell.edu or I also get the TCP Group and Packet Radio digests, and will see responses that show up there.

The issues that we are trying to determine are:

ka9q setup related:
^^^^^^^^^^^^^^^^^^^

1) How well ka9q works with POP mail. Also, what version or variant of ka9q NOS works best as a POP mail server, and where to get it.
2) How well it works over a dial-up connection, and over an ethernet LAN, and any tricks that might help in setting it up.
3) Whether one can reliably use a client software package like NUPOP over a TCP/IP packet radio connection. We are considering using NUPOP or some equivalent offline reader/composer to lower connect times, and would like to be able to use the same client package for all users of the network.
4) How much direct supervision ka9q NOS needs to operate reliably, and how much technical backgound it requires of an operator.
5) How difficult it is to install and maintain a packet radio installation running ka9q NOS and what the level of technical training a sysop would need to install/manage it. Also, how well does it recover from crashes (for example, from frequent brownouts...).
6) What hardware would be recommended (from the computer itself (processor, RAM, hard disk, etc.) to the TNC, radio, antenna, etc.) for a network where we would like to be able to support 1-2 modem lines, a packet radio station, with 100-500 users (54 users initially, but I anticipate it will expand with both official and unacknowledged users). The primary use would be simple email, but will probably also include some larger document transfers (uuencoded), and it would be nice if we could also set up an ftp site and remailer for interest groups. Maximum transmission distances will be no more than 100 km (we would prefer to use UHF or VHF and avoid HF), but want a set-up that also takes into account local conditions (i.e. high temperature, high humidity, long rainy season with *heavy* rainfall, frequent lightning, etc.).

Other Issues (added in case you might have any experience/answers):
^^^

1) Whether it is possible to use NUPOP to connect over a serial (dialup) line in cases where you need to place the call through an operator. (ie, if it is possible to write the connection script so that you can take the modem off line while placing the call through the operator, and then bring the modem (and NUPOP) online again as soon as you hear the carrier detect.
2) How difficult (or easy) it is to write gateway scripts to forward mail to and from other networks (ie FidoNet, UUCP, etc.) from ka9q NOS.

Those are my main questions for now. If anyone has helpful comments, suggestions or resources to offer I would greatly appreciate them (particularly from people who have experience setting up such systems in

developing countries). Also, anyone who would like to send me a copy of
their autoexec.nos file (if they think it might be helpful or instructively
related to our project), they would be welcome. You can resond to me
personally at: eb15@cornell.edu or I also get the TCP Group and Packet
Radio digests, and will see responses that show up there.

Thanks in advance,

Ned Bade

Is there anyone running any version of ka9q/nos/net on a MSDOS
machine in MS windows. I can start them in a DOSBOX, and it runs.
I can start a telnet session to a Unix machine on the same ethernet.
I get a login prompt. And i get logged in. But the windows system
goes down. I get back to the dos prompt and the machine is corrupt.
Is there any way to configure nos or windows to get this running ?

There have been a couple articles over the past 2 months in QST that concerned the Automatic Packet Reporting System. The APRS allows one to connect the NMEA-0183 output of a LORAN-C or GPS receiver to a packet system such that the location of the packet station is constantly reported to a remote location where the location is displayed in real-time on a map.

The article (don't have the reference handy at the moment) gave a name and address to obtain the software (shareware). It also stated that it was available on several non-specified BBS systems. Does anyone know if it is available via FTP on the net? I've checked most of the FTP servers that carry HAM related info that I know about, but so far haven't found it.

Thanks,
Ray WB6TPU

I would like to go portable on packet and now I wonder what is the (physically)
smallest TNC available? I will only need to be active on vhf/uhf.   Power
consumption is also an important factor.
It seems to me that a tnc could be made extremely small...

I have not been looking in mags/brochures for years, so I have lost touch with
what the state of the art is. :-)

Jim... SoftKISS does some variations of this and it works with NET/Mac
the original NET software by KA9Q. There are many mods to this that now
support the TNC'less operation you have described. Whether or not it
can be used with the VeraTerm software.. I'll have to rely on others to

help you out.

>Yep doing it here.. i run a baycom modem and DV with tpk and a phone bbs..
>works fine no problems..

Agree. I'm running the baycom with DESQview/X, and it's works just fine. With
Windows, it's impossible to run L2.EXE, beacuse windows want's to handle every-
thing (almost) ;-). If you want to run baycom in dvx-window, you should have
at least 386/33MHz. However, if you don't need to use scaled windows, use the
standard DESQview instead of DESQview/X. It's much faster. I tried to run
baycom in /X in Compaq Contura 3/25c (386SLC/25MHz), it worked sure... but...
slowly.

Why I'm using the dvx; just for that, that I can edit text files and run
i.e. 7PLUS at the same time, when I'm logged in to local packet-bbs.

Sepi,
Does Baycom handle its port monitoring using interrupts or polling?
PMP uses polling, so if Baycom uses polling, too, then I would have some
confidence that it would work with Desqview if Baycom does.

Thanks.

I have a BayPac modem that works fine with the testing software that comes
with it, but doesn't transmit when used with a terminal program like
baycom 1.4, 1.5. In baycom, i think it receives fine (in my area I can't
receive any packet, yet) but when there is noise, the indicator on the
left hand side goes from QRV to RECV, but when I set the program to
:beacon 1, on screen it transmits, but my radio's xmit lite doesn't light
up. Is it a software problem? What can I do?
Please help soon!

Thanks in advance,

Dave, N2RQU

>In case a few of you missed it, the August '93 issue of 73 Magazine
>is featuring an anthology of 73 packet radio articles from 1983 to 1993

It's actually a bibliography, but that's not your fault. 73 used the wrong
term too. An anthology (as I understand it) is a *collection* of articles
rather than just a listing.

OK, I promise to stop acting like an English teacher. I wish they *did*
publish a real anthology.

BTW, I'm going to build that deviation meter... I've got the parts, now give
me some time!!

You could try my gateway, but I don't know how much quicker it would
be. BTW - I am running N0ARY's bbs code so the interface would be the same.

I have to agree. I have been running N0ARY's BBS code on my system, and from the sysops side it has been a dream. There are many functions and features for the sysop that make running the BBS a pleasure rather then a chore. I was about ready to give up my BBS because it was getting to be such a pain.

raymond.anderson@Sun.Com says:
> The APRS allows one to connect the NMEA-0183 output of a LORAN-C or
> GPS receiver to a packet system...

I once thought about a poor mans position display. After deciding that DME, GPS, and LORAN were too expensive, I thought about simple triangulation. With a programmable radio that tunes in a VOR, it can run through the navigation channels and put the bearings into a table. Since all VOR's are known by their latitude and longitude you can find your position. With this info you can plot the VOR's and your route on a moving map. Taken a step further you could broadcast your information over a common frequency:

Registration *
Type *
Destination (ICAO)*
Latitude (seconds)
Longitude (seconds)
Altitude (feet) *
Heading (Magnetic)
Ground Speed (Knots)

One mode could show various ranges and another could show targets within five nautical miles and 5000 feet. The items marked with an asterisk are entered by the operator, the others are calculated. The FAA could then dismantle it's transponder system :-)

This is *not* a big problem, since the cell of coverage of a repeater is
generally metropolitan in size. However, most digital repeaters do bit
regeneration, thus the transmitted bit rate may not be exactly the
same as the received bit rate (the reason a FIFO exists in the
repeater's bit regenerator is to allow for variations in clock rates).

I *tried* to implement a system of matching transmitted with received
back from the repeater streams to determine if a KISS based TNC was being
collided with, and a sliding window (to find a match) is not that hard to do!
I never finised the project for the same reason many never finish (the
thought experiment was done, why finish? and not enough money to afford
a set of cans for 2M or 70cm at the time).

>This requires a synchronizing adjustment be made.

why, computers can do it, why should you have to?

I have just hooked a Tigertronics Baypac modem to an Icom IC24AT to
use on 2 meters. The hookup was simple and works quite nicely, but
I'm having a harder time hooking up to some stations than I think I
should (I can hear them fine).

If anyone else has a similar setup, I'd appreciate hearing what
settings you are using for volume, squelch, audio level on the
Baypac itself, "TNC" parameters like TXDELAY, and so forth.

By the way, I'm using an HP100LX palmtop as my "PC," and it makes
for a tiny little packet setup!

Thanks loads,

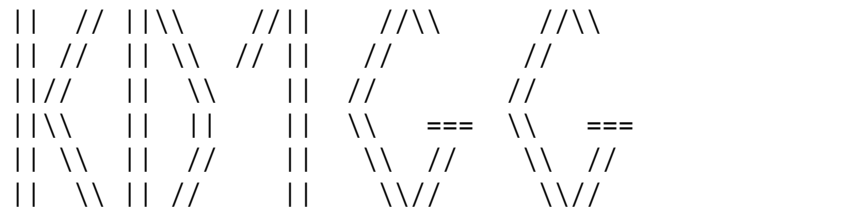
>It seems to me that a tnc could be made extremely small...

The Tigertronics Baypac modem is not a true TNC, but when used with
the Baycom software on a computer, it amounts to the same thing.
The Baypac is about the size of a 25-pin RS232 conenctor shell and
weighs a couple of ounces. Soooo, if you have a computer (IBM clones
will work, but software is available for others, I'm sure), this is
a tiny way to go! Oh yea, it just uses the power from the RS232 line
and/or the audio output from the radio. Kinda reminds me of crystal
rigs when I was a kid -- powered from the ether!



Cheers,

Question was about using packet to communicate between school buildings.
Answer would seem to depend on whether you are doing it to teach students
about amateur radio (packet), or conducting the business of the school.

As far as I can tell, "packet" can work on any frequency. If you are
doing business, get a license (and appropriate radios) suitable to your
school district (Local Govt, probably), and run on an FCC-authorized
business or govt frequency.

Well...I guess I'd give myself a D+ for HAM-server over the week or so.

I placed a second HD online to create more disk space for HAM-server files
then proceeded to mess up all the config files so that HAM-server couldn't
find the new directory. For three days I couldn't post or send email.

So, radio pals, if you have ordered from HAM-server within the last week or
ten days and have heard zip, reorder.

Sorry for the inconvenience.

BTW...there is now close to 40-megs online.

My 2 cents worth.....

   First of all, there are two different type of Internet/Packet gateways.
1). Email Gateway.
    This allows AX.25 BBS users to send mail to Internet Users and vicea versa.
2). Internet/Ampr.Org. Gateway.
    This allows a packet radio operator to talk to other packet radio operators real time using the Internet as a gateway between sites.

   Some gateways are email only gateways, some are Internet/Ampr.Org. Radio gateways, and some are a combination of both.

   I'm more familiar with the Internet/Ampr.Org. type gateway. For that, you need a PC with a physical connection to the Internet (not a UUCP link) and a physical connection to a packet station. Generally, you have a either a SLIP or lan connection to the Internet and one (or more) tnc/radios connected to your gateway.
   With a PC that has a Internet connection and a TNC, can you can run NOS (Radio TCP/IP) to control the PC. NOS can handle either ax.25 or tcp/ip connects and route them to another Internet/Ampr.Org. gateway. You can restrict the type and direction of traffic through the gateway. As is... NOS doesn't handle AX.25 to Internet and Internet to AX.25 BBS traffic very well. NOS will do AX.25 type BBS forwarding and Internet users can address mail to ax.25 bbs users, but going from the ax.25 bbs world to the Internet doesn't work well. You can long on to a NOS gateway using a standard ax.25 connect and then send an Email message to an Internet users, but you can't forward mail from an ax.25 style bbs through a Internet Gateway to an Internet user easily.
   If all you want to do is handle Email traffic between ax.25 users and Internet users or all you have is a UUCP link, then you might want to fire off a note to n0ary and ask him about his set up. If you want more info on setting up an Internet/Ampr.Org gateway, either send me an email message or subscribe to the NOS-BBS mailing list. It's nos-bbs@hydra.carleton.ca.

Jack, thanks for posting this clarification. It is easy to get confused because the term "gateway" is used for both situations.

I just discovered the Peninsula Internet/AMPRnet gateway a couple of days ago. It's great fun! Just a couple of minutes ago, I sent a message from winter@apple.com to n6bis@n6bis.ampr.org; I set the verbose flag on the outgoing message and have trace running on my packet station, so I was able to watch both sides of the SMTP session! Pretty nifty.

I also had direct SMTP sessions with AMPRnet and regular-Internet sites in Texas, Massachusetts, and southern California.

Note that all of my connections to non-AMPRnet sites were to licensed hams, so when they respond, it will be a ham initiating the transmission on amateur radio. I don't know what other people are doing about this, but I intend to restrict my use of the gateway to only contacting other hams.

>   I'm more familiar with the Internet/Ampr.Org. type gateway. For that,

>) tnc/radios connected to your gateway.

Just to make this clear--this is what you need to *set up* such a gateway. To *use* it, you only need a simple amateur TCP/IP packet station.

>to a NOS gateway using a standard ax.25 connect and then send an

Maybe not with NOS, but Bob Arasmith's own software is handling this situation excellently.

73,
Patty

>That's CARRIER sense, multiple access. The CD, collision detection,
>mode of ethernet isn't possible in a simplex system.

Lets be technically correct. Ethernet and IEEE 802.3 are simplex CSMA/CD.
Collision Detection by the "sum of energy on the medium" technique used by
Ethernet is not practical in a system that has significant transmission
attenuation. In Ethernet, the total energy on the medium, measured at the
output of your own transmitter, during a collision always exceeds 150% of
your own signal without a collision. In the near field of your packet
station antenna the energy present during a collision is much less than 101%
of your own signal without a collision, even if the colliding station is only
a block away running 10 times your power -- ergo, no CD!

There are many ways to skin the CD cat -- full duplex repeaters do so nicely, are easy to implement (off-the-shelf equipment) and modest in $ cost; they are very wasteful of a more precious commodity, spectrum.

Slotted systems are not trivial but ample technology exists to solve all of their problems -- there may be no amateur up to (willing to expend the effort) developing an "AX-Slotted" packet system.

Spread Spectrum offers a multiplicity of possible solutions, many inherently Collision Avoiding.

Opportunity exists for novel solutions, like a signaling system that provides aperiodic silent buads that would permit interspersed brief listening intervals during packet transmission to allow for weak signal detection. This for sure does not in itself handle the situation where Station A causes QRM at Station B but a can not be heard at Station C which is transmitting to Station B -- however if Station B, having detected the collision, transmits over Station A causing a collision detectable at Station A the problem is solved. This technique will allow Station B to detect when Station A aborts its transmission and can then stop transmitting. Fast recovery receivers and fast TR switching is required, but there is no free lunch.

Given the spectrum crowding that exists, the time is ripe for some creative effort in the amateur packet community. Perhaps this is a good topic for a paper at the next ARRL Networking Conference -- any potential co-authors out there?

I have two questions concerning file compression. They are:
A. As I monitor a channel where a lot of compressed files are passed - and I frequently hear my "bell" (on a glass-eye?? NOT!) ring and I see "smiley faces" and other graphics rip by, I wonder: could binary code be sent that could be addressed to a particularly user (or users) who are monitoring? In direct words - could encoded transmissions (binary) create any kind of danger to those monitoring? Just asking and wondering aloud - I'm making no claims or accusations, merely asking a question. No flames, please.

B. Is anyone working on compression for use with G8BPQ and W0RLI code. I use both - and would not like to have to change because I need compression to help decrease channel congestion but can't find it in those two software packages. So does anyone know of anything in development?

I would like to find out some info on packet.

What I want to do is transmit on a freq and be able to recive the data with out sending ACK back ie the reciveing end can not transmit. Can this be done with the Packet type devices. DSU/CSU haft to have ACK to get the data across and also Modem. Also what speed dose Packet devices run at? 9600 bps max? About what are the cost of these Devices?

I think that perhaps the second best solution is a system which has some kind of coordination which guarantees no collisions. Time and frequency slotted schemes fall in this camp. Signalling on a separate (in time or frequency) control channel would as well. Spread spectrum would not.

I think that the *best* solution may be one which avoids the problem that CD attempts to solve, that of having to divide a physical channel among a number of users. Inherently this sort of division reduces per-user capacity. It does not maximize reuse. If users have to listen to information not directed to them they are already at a disadvantage.

Ideally we would like to optimumly utilize our resources, financial as well as spectral. In the 9th ARRL CNC (now called Digital Networking Conference) my "physical layer" paper points out the advantages to using higher frequencies and antenna directivity to eliminate the collisions. I believe that as information volume*distance gets larger and larger, eventually point-point links over low-loss transmission structures are required. With radio this means columated beams and in general shorter wavelengths/higher frequency to get the low beamwidths and enough spectrum. Fortunately in the bands where we currently have sufficient spectrum we don't experience a great deal of crowding.

At this time, getting fully dedicated point-point links to all users of an amateur network seems out of the question. Eventually, I suspect that optical fiber will be the big winner since it excells in terms of low attenuation and "focussing" of the information energy. However, even though we don't have the ultimate physical layer at this time I think we can do a lot better than we are.

Rather than continuing on in the multiple access/divided-channel mindset permanently, I think it better that we at least start to steer ourselves toward more efficient use of amateur resources.

In the same 1990 CNC proceedings there is another paper, which I co-authored with n6rce and n6plo, describing an intermediate solution, Hubmaster. This uses a combination of antenna directivity and polling to achieve more efficient use of hardware while allowing for greater spectral reuse. This is a combination of collision prevention (directional antennas allow low sidelobes and lower power transmitters to protect nearby clusters and allow greater spectral reuse) and collision avoidance (in the form of a protocol, a kind of coordination, in which stations transmit only when approriate).

Lest anyone midunderstand, I do not mean to imply that we should not seek ways to increase efficiency of current packet systems by collision detection and avoidance. On the lower amateur bands (below 1 GHz or so) we are, to a degree, inherently multiple access and we must do something. However, for higher performance networking involving higher volumes of information and greater distances, I think we need to turn to other solutions.

Jack says that u need an IBM (or compatible). Yes, thats true right now, but
not for long. I am rewriting parts of the NOS software (for UNIX machines)
to allow a computer running UNIX, for example a Sun Microsystems SPARC station
to act as 3 different types of gates:
        1) Email
        2) Wormhole (i.e.) Packet -> Internet _> Packet somewhere else
        3 Packet <-> Internet

Once I am finished, I will give the new version of KA9Q nos to anyone who wants
it.

What are the specific rules about such transmissions ? Which of
the following would be disallowed:

1. Reading Newsgroups via packet from a commercial machine
   connected to the Internet.
2. Sending email to ham subscribers
3. Sending email to non-hams on the Internet.

Or is the legality of the transmission dependent on what you send/receive
rather than who you send/receive to (as in voice) ?

This first one is probably a *really* dumb question, but I can't seem
to find it. The others hopefully aren't so dumb...

I FTP'ed the meteor scatter program that was recently discussed. The
setup requires entering the locator grid square (2+2+2). How do I find
mine? Is there a map somewhere, a chart, what?

Also, I've gotten stuck trying to exit the parameter setup program,
"par". How do you get out? Same question for the main program.

Finally, included with the software was a freebie text editor, "ted".
There was no documentation for it and no apparent on-line help. Other
than the 10 function keys, none of which are for help, I have no idea
what the other commands are nor where to find them. Is there a help
screen or other on-line help? Any ideas?

   First of all, let me say (if I haven't already) that the MAIN purpose of an Internet/Ampr.Org gateway is to allow the sub pockets of radio IP users to communicate with each other. Some gateway will allow users to access some non-Ampr.Org. things but some won't. It depends on the sysop and the users. If all your looking for is a cheap method to access the internet, you're better off at looking at Delphi or some other landline service provider.

   Now that that's said.... There are three major considerations.... first and foremost.... you don't want a non-ham to initiate a contact via packet. i.e. ... the gateway restricts Internet initiated telnet and smtp sessions from being routed over the radio port. The gateway may accept these connections, but it shouldn't let them be routed over the radio port under normal procedures. For example... you shouldn't be able to telnet to callsign@callsign.ampr.org from a standard Internet site. If you're using a Ampr.Org gateway or an Ampr.Org IP address, it should work. Going the other way... callsign.ampr.org to ucsd.edu for example, should be legal (as far as the FCC is concerned) because you are initiating the contact and are acting as the control op. In the other case, the non-ham internet user would be initiating the contact and acting as the control op. A clear violation of the rules.
   As for SMTP mail... it's usually set up so that mail goes to the gateway and then is popped (using the POP client and server) from the gateway by a user. That way the traffic is not sent over the radio by the Internet site, but rather the packet radio station ask the server for any mail that he might have and is in effect, the control operator.

   The second factor to consider that that the Internet does not need to follow the FCC-Part 97 rules and regulations. You can say and do things on the Internet that can get you fined if they go out over the air. Is some LID tries to access the alt.sex news group or something like that the gateway operator will be one of the ones that the FCC goes after. He's the first station in the list of stations that transmit the illegal info, so you have to be careful there. There can also be illegal messages in standard new groups. That is why business and profanity is frowned opon in

Ham-Radio newsgroups and mailing list. Many of these mailing list are accessible via local Internet/Ampr.Org gateways. Especially when the gateway offers high speed access.

   Lastly... 1200b packet is SLOW. There is a TON of info on the Internet and if you try and do something stupid like FTPing a 12 MEG file over 1200b, you'll hose of the freq for everyone for a very long time. You have to realize the 1200b is really really slow and adjust your use accordingly.

   Hope that about covers it. Please let me know if I got something completely wrong. Some of the rules governing Internet/Ampr.Org gateways are in a VERY GRAY area and are open to interpretation. Each gateway sysop has to be able to prove to himself that he is following the FCC rules in his normal course of operation.

More details on observing the Perseids meteor shower, and on the best time to watch, below.

Quoting from the Friday, August 6 1993 San Francisco Chronicle :

> _New Dust to Light Up Meteor Show_,
> by David Periman, Chronical Science Writer
>
> Perseid time is coming again, and as it does each year, a shower of meteors formed from the dust of an ancient comet should streak across the sky all night long, all next week to delight patient star-watchers.
>
> But besides the display of shooting stars, which many scientists believe may be more spectacular than usual [see below - rc], this year's meteor shower is unusual because nearly 2,500 amateur radio operators around the country will be bouncing their signals off the blazing tails of the meteors in an attempt to achieve record distances for their transmissions.
>
> "It's a once-in-a-lifetime opportunity for us", because of the expected intensity of the shower, said Russ Bentson of Belmont, an electrical engineer who has been talking to fellow amateurs with his single-sideband ham outfit for more than 30 years. About 50 other Bay Area amateurs will be making the same attempt, Benston said.
>
> His normal range for transmitting signals in the two-meter band, he said, is about 400 miles. But by reflecting his transmissions off the ionized debris that trails behind the Perseid meteors, Bentson expects to chat with radio friends as far as 2,000 miles away for the first time. He and his colleagues will be broadcasting at a frequency of 144.2 megahertz, for those who want to tune in. "The Perseids are not only a visual treat," he said, "but they're an electronic wonder."
>
> The meteors, which arrive on schedule every August, get their name because they seem to rain down from the constellation Perseus.
>
> But precisely when the shower will reach its peak - probably some time Wednesday night - is impossible to predict, said Andrew Fraknoi of the Foothill College Astronomy Program, also executive director of the Astronomical Society of the Pacific.
>
> [Those of you acquainted with the Bay Area astronomical scene will probably better remember him as the germinator of Sidewalk Astro--nomers, whom built their own telescopes out of wildly painted cardboard tubes discarded by carpet stores, and hand-ground their lenses, then delivered them to unexpected locations for people to be given the opportunity of seeing the sun or the moon in vivid detail - bringing astronomy, as it were, to the streets.]
>
> The Perseids are not really stars, but debris from a comet named Swift-Tuttle that ... [returns] every 130 years. The comet came close to the sun in 1862 and made another close pass last year -

adding a fresh rivulet of particles to the debris cloud each time.

[snip, snip]

The meteors should begin appearing as occasional flashes in the dark sky Monday or Tuesday night, Fraknoi said, and after peaking Wednes--day, they should continue in a diminishing shower Thursday.

[snip]

The best way to watch for the Perseids, Fraknoi said, is to find a high hill away from background city lights and where plenty of sky is visible, wait for the eyes to become dark-adapted, then scan as much of the sky as is possible in every direction, without binoc--ulars or telescopes.

< end of article >

I'd like to second what Mssr Fraknoi says about binoculars not being needed. Any sort of visual instrument will inevitably narrow your vision, and allow you to observe that much less of an already vast perspective. It's just another heavy thing you'll have to lug along and worry about forgetting.

One (or more) sleeping bags and a ground sheet and some food and drink would be advised, however. Also, a flashlight with a red lense, if you can swing it - bright light disturbs dark-adjusted eyes.

As it so happens, meteors are sufficiently brilliant that, in a very dark place, you stand some good chance of seeing them even through peripheral vision, as well as when they happen right in front of your eyes. They are very small, very bright, and very fast - they cannot help but stand out against a dark and relatively unchanging sky. (-:

You might even see this in the middle of the city, if you have a clear sky and a relatively dark roof to lie down upon.

According to _Quirks And Quarks_ (heard on KALW 91.7 FM, SF), there are three predicted 'best' times for viewing (although such predictions should be taken with a degree of uncertainty, since no one can really say where on the planet they will arrive ... just when) are as follows :

Wednesday 10 PM EST	7 PM PST (California time)
Thursday 8 AM EST	5 AM PST (California time)
Thursday 11 AM EST	8 AM PST (California time)

The University of Texas' excellent astronomical show (which I don't recall the name of, but have heard, through its many incarnations, on public radio, and seen postings from the illustrious Debbie Byrd, right here on the Net, usually in sci.astro) notes that the moon will be rising around midnight, as of this evening (Monday, today) ... so the best viewing, if any, will probably be Wednesday evening.

Quirks And Quarks notes that the meteors appear to emanate from the
northwest, so any hills you choose should look in that direction.

Enjoy !!

Greetings!

I'm looking for the manual to a Kantronics "The Interface" (circa 1982), a
CW/RTTY encoder-decoder. I'd like to possibly set up this box for use one of
these days, and would like to get the jump on the manual. Copies considered.

Thanks and 73,
Derrick

From the northwest during predawn hours when the moon will interfere this
year. During the early evening they will emeanate from the NorthEast.

I.e. they come from the direction of Perseus, hence the name.

[a good summary of some of the legal and technical issues involved in making connections between the AMPRnet and the rest of the Internet.]

There's another security issue. If you log onto a remote node over amateur radio (whether you're logging onto a non-Net 44 site from a Net 44 site, or vice versa), you're sending your password over the air. Sure, the odds are slim that anyone would both (1) be watching your packets at exactly that time, AND (2) want to use the information for nefarious purposes. But I sure wouldn't want to take the chance.

IRQ2 on the bus IS USABLE on all IBM AT and 386 machines. On the bus it is IRQ2. On the software side, it is referred to as IRQ9. A technical reference manual will point you to the proper location in low memeory for where IRQ9's vector is stored. Most software DOES support the use of IRQ2/9, including the microsoft mouse busmouse board/drivers, etc.

What is really needed in the market is a board that allows individual assignments of IRQ's 2,3,4,5,7,10,11,12,13,14,15 for EACH of 2 or 4 serial ports. I have done a lot of searching and have come up empty. I may have to design one.

>

Jamie, I have used my HP95 on packet and it works fine. I purchased the
serial interface kit from HP which includes a bunch of connectors
(DB9, DB25, etc) that have a RJ11 type female jack on them. There is
another cable provided with the small 4 pin connector for the HP on
one end, and a RJ11 male on the other end to plug into any of the
standard connectors provided. I use it with a KPC3 fine at 9600 baud
(HP --> KPC speed). Makes life simple and reliable! If you do use the
modem cable, remember it is a NULL modem connector so you will need to use
another NULL modem adapter to re-reverse the wires. They ship the modem
cable as a NULL modem cable since people use it for HP95 <--> PC connection.

Hello all,

Over the last couple of weeks I have seen a number of questions on
where to get the latest versions of both NET/Mac and IM/Mac...

Maybe I should tell you how to get those, and maybe tell you even a
little more than just that...

Ivo ON1XK, the 'father' of IM/Mac (Ivo's Mailer for the Macintosh) has
no access to the internet (yet), so he cannot send out newer versions
of his famous program. He has asked me to take care of that. Since I
myself cannot FTP to the internet (yet, this may be solved by the end
of the year) I can only send out newer versions over e-mail, in StuffIt
BinHexed format.

I maintain a distributionlist for both IM/Mac and NET/Mac, so if you
don't know where to download the software from, just leave me a note
and I will send it over to you, or put you on the distributionlist,
whichever you like.

Please indicate: on which of the lists (or both) you want to be
            and: if your mailer will accept binhex files, which are
                 larger than 32K
if you have one: you hamradio callsign

If you want to e-mail to Ivo or myself... Our mail-addresses are:

on1xk@igg.tno.nl   and   pa2aga@igg.tno.nl

Our holiday-schedule:

on1xk   from July 10 until august 27
pa2aga   from august 11 until august 31

The latest versions are:

NET/Mac 2.3.24
IM/Mac 1.0b27n

  I recently read somewhere that the FAA is using PK-88's in some of their
towers around the country. (Oh my gosh, does that mean that there may be
some airborne packet going on? Geez. Radios and TNCs and computers in
planes!!! Oh my gosh, they must just be droping like flies from all the
'interference'!!!! hehehe)

  Or maybe they're just for tower-to-tower comms. (not as much fun)

  Also, the local NOAA weather office has put in a TNC for severe weather
notices (sent as CQs or unprotos.).   This is on amateur bands by one of the
hams at that NOAA office.

: Why bother? Apart from infringing the Copyright on KA-Node and Net/Rom,
: you're gonna waste *alot* of time in coding something suitable. Blow a copy
: of TheNet X1H (including tcp/ip auto routing) and leave the rest to the
: programmers.

I want to bother because I am not using a politically correct computer
and I also happen to be a programmer. I would like to write a
networking package that fits in with the style of this machine, which
NOS doesn't. Since NOS implements NET/ROM I assumed there would not
be a problem (and I think they only get protection if they patent
their protocol anyway). I can do without the KA-Node if kantronics
is going to be upset about it. NET/ROM appears to have been cloned
already anyway though so I don't see that there should be any problem.

Basically, I want to put the TNC in KISS mode and have my computer
run everything. I plan on implementing a BBS, and other features
common in the packet world would be nice as well. I already have
TCP/IP and all that remains is to write an AX.25 driver for it.

Actually, I would like to know about the legalities involved as I think
there are enough incompatable routing protocols around already. While
I will be primarily using TCP/IP, there is a lot of NET/ROM in the
area, and it would be nice to interface with it.

I helped set up a VHF/UHF/HF network for the Philippine Department of
Health a few years back. There are TNCs available that have encryption
options for non-amateur use, also. I think AEA makes them.

Greetings. Having just moved from one QTH to another, I find myself
missing my documentation for my MFJ 1270b. I have come into posession
of the higher speed CPU and SIO needed for "high-speed" operation and
have them installed, but don't have a clue as to which jumper I need to
move to change the speed.

Any help would be greatly appreciated.

Hello All,
   Not too long ago, I remember someone posting a message saying they would be happy to use his/her internet address to pass on traffic to G8BPQ and vice-versa periodically. I seem to have copied down the incorrect address or this party no longer exists at that address. Can anyone provide me with information about this address, or a way to contact G8BPQ, John Wiseman.

Thanks!

Dan

This is another request for info on hooking up a pk232 to a ts440. Someone posted an article a while back about problems with the ts440 staying keyed after transmit... Did anyone save the article???? I need it.

Message-ID: <742288454snz@tedb.demon.co.uk>

Good morning. It's Sunday the 11th of July and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

First the headlines: We have news of some 50MHz award successes; the RSGB EMC
Helpline is no longer needed; and deadlines are imminent for Young Amateur of
the Year nominations and for AMSAT-UK Colloquium booking.

The RSGB marks operating successes by sponsoring various award schemes. Among
the Society's VHF and UHF Certificates awarded recently was the first ever
RSGB 50MHz Certificate to go to the holder of a UK Novice License. This was
issued to Pat Williams, 2E1AFN, when she claimed the 50MHz 10 Countries
Two-way Award Congratulations also go to Geoff Brown, GJ4ICD, who was issued
with the first certificate for having the grand total of 450 squares confirmed
on the 50MHz band. If you would like further details of the VHF/UHF award
scheme, information sheets and application forms may be obtained from the RSGB
VHF/UHF Awards Manager Ian Cornes, G4OUT on receipt of a stamped, self
addressed envelope. G4OUT address is correct in the RSGB Call Book.

Due to the success of the RSGB's EMC Co-ordinator scheme and the publication
of the Society's new EMC manual, 'The Radio Amateurs Guide to EMC', the EMC

Helpline has been found to be no longer necessary. The Helpline will, therefore be closed down. EMC is Electromagnetic Compatibility or in plain English not interfering with your neighbours' electronic equipment, or vice-versa. RSGB members who have EMC problems which they cannot solve themselves should contact their EMC co-ordinator whose telephone number can be found in the RSGB Call Book, and also on page 59 of the June 1992 issue of Radio Communication. If a problem cannot be dealt with by the co-ordinator he or she will call on the advice of a committee member who specialises in that particular type of problem.

Now a reminder that the deadline for nominations for the 1993 Young Amateur of the Year Award is the 31st of July. Full details of this prestigious award, and the associated prizes, can be found in the April RadCom, or can be obtained by writing straight away to the Project YEAR Coordinator c/o RSGB HQ.

The AMSAT-UK Colloquium takes place at the University of Surrey on the 29th of July to the 2nd of August. For reasons of University security, this is an all-ticket event. Anyone wishing to attend this fascinating event, and who has not already booked, should contact AMSAT-UK within the next two days on 081 989 6741.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Cayman Islands, WA6VNR and N6RLE will sign ZF2AH and ZF2JT respectively from now until Tuesday the 13th of July. From Tuvalu, JF2MBF will sign T28JJ from now, until Tuesday the 20th of July on the HF bands, activity to including some RTTY. From the British Virgin Islands, K8CFU will be active as VP2V/K8CFU from now, until Thursday the 22nd of July, mainly on 20m. From Liechtenstein, a group of French operators will be active as HB0/own-callsigns from Saturday the 17th of July for one week, on 80 to 10 metres, but excluding the WARC bands.

We know of two rallies taking place today, Sunday the 11th of July:

The Horncastle Amateur Radio Electronic and Computing Fair is being held at the Queen Elizabeth Grammar School Sports Hall, Horncastle, Lincolnshire. The event features clubs stands and a bring & buy stall. Catering facilities are available on site, run by the Horncastle Youth Club staff and members. Talk-in will be on channel S22. The Sussex Amateur Radio and Computer Fair is being held at Brighton Racecourse. Doors open at 10.30am. There are trade stands and a bring and buy stall. Refreshments are available and there is also a picnic area close by.

We know of only one rally for next weekend:

The Radio Society of Great Britain National Mobile Rally will take place on Sunday the 18th of July at Woburn Park, near the famous Abbey in Bedfordshire. Leave the M1 via junction 13, whether arriving from the North or South and not 12 as signposted, and follow the signposts to Woburn Abbey. Watch out for the RSGB signs. Do not follow the signs to the Game Reserve or the Wild Animal Kingdom. Doors open at 10.00am. The rally features a large trade exhibition, an RSGB Bookstall and enquiries stand, a BARTG stall and a members mart area all under cover. All the normal Woburn attractions will be available at a

small extra charge. Refreshments are available nearby. See July Radcom page 41 for full details and a map of the surrounding area. For further information contact Norman Miller, G3MVV on 0277 225563.

HF contest news now:

The Colombian Independence Contest will take place from 0000 to 2400 hours on Saturday the 17th of July. Contest exchange is the report plus the serial QSO number from 001, on 3.5 to 28MHz. Categories are SSB or CW but not mixed. See July RadCom page 12 for further information. The RSGB Low Power Field Day Contest will take place on Sunday the 18th of July, from 0900 to 1200GMT and 1300 to 1600GMT. This is CW only on 3510 to 3560kHz and 7010 to 7040kHz. See July RadCom page 81 for the power output categories and equipment special conditions

VHF contest news:

The RSGB 144MHz Low Power Contest will take place on Saturday the 24th from 1400 to 2200GMT. It features four entry sections: single operator fixed, single operator portable, all others and short wave listener. The RSGB 432MHz Low Power Contest will take place on Sunday the 25th of July from 0800 to 1400GMT. February RadCom on page 66 has further details of both of these events.

News now of a special event station:

Starting on Thursday the 22nd of July, for six days the callsign GB70CT will be aired by the Loughborough and District Amateur Radio Society. The occasion is the 70th anniversary of the Loughborough Carillon War Memorial, a free standing bell tower 152 feet high. Further details can be obtained from Alan, G0PHT who address is correct in the Call Book. This event is also featured on page 5 of the July RadCom.

And here is the solar factual data

The period from the 28th June to the 4th of July saw an enhancement of the HF bands up to the 30th. This was followed by a collapse to poor conditions due to the passage of coronal holes and a series of M type flares. The largest was an M4.3/2B on the 2nd July. A magnetic sub-storm resulted which depressed the HF bands. The sun spot count has generally declined and meaned at 99. There has been a similar decline in solar flux which averaged 114 units. The geomagnetic Ap indices started at quiet levels but, with the flares, levels climbed to sub-storm reaching 27 units on the 2nd. The period averaged 16.4 units. The state has been 'quiet' then later in the period 'Magstorm in progress'. The radio quality indices improved to very good up to the 30th with the enhancement, then collapsed to poor levels with the 2nd and 3rd being down to very poor on all circuits. For the 22nd to the 28th of June the geomagnetic aa indices ranged from quiet to unsettled. The 22nd and 28th were at quiet levels, down to 9 nanoTeslas, and the 24th and 25th were unsettled up to 47.2. The period averaged 20.6 nanoTeslas. The X-Ray flux has been reasonably steady and averaged B3.0. The sun spot count for June was RI 49.1 with the smoothed index for December 1992 being 73.1+-5.

Now the ionospheric data for Central France:

There has been a series of equipment breakdowns so data this week is not complete. The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 7.2MHz though levels ranged from 8.8MHz on the 29th down to 6.1MHz on the 4th. The darkness hour lows averaged 4.7MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 6.7MHz and the darkness hour lows 5.3MHz. Solar cycle 22 is declining so rapidly that the official forecasting of the ionospheric IF2/12 and the IG/12 spot index is causing concern. The answers coming out based on comparison with previous cycles shows that the rate of decline of cycle 22 is at least ahead by one year. The importance of this is considerable as the basis of almost all CCIR based ionospheric forecasts use these parameters.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way, and no flares are expected. Flux levels are expected to be about the 85s. The geomagnetic activity is expected to be quiet. Ionospheric radio quality indices are expected to be normal based on previous rotations.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T W and G7 O X series, and Novice calls in the 2 0 A F and 2 1 B Y series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

The net/rom protocol is not documented in any complete way that I've
seen. There is a brief discussion of it in the net/rom manuals, and
several people have reverse-engineered it to create the TheNet, G8BPQ,
KA9Q, and other implementations of it. TheNet and KA9Q sources are
readily available if you want to work from existing code.

While you're at it, fix it.

Ok. I know that recently there were several Internet - Packet
gateways mentioned here, now that I am looking for those posts
I find they've expired off my system. :(

Can anyone send me that info? (addresses etc.) via email? Or
post it here?

Thanks!

Hello...

We have a G8BPQ node here with two radio ports and one serial port connection to another machine running JNOS. The JNOS system is sending all these wondering DX NET/ROM style nodes that it knows about throughout the Internet.

What I would like to do is continue to have the machine that is running G8BPQ add these DX nodes to its table while *supressing* the distribution of these nodes over the two radio ports to my neighbor nodes through the hourly nodes broadcast.

The link to the machine running JNOS is a KISS link. It doesn't have to be a JNOS system on the other side (if that helps avoid confusion). It could be a simple system such as a single machine with two radio ports in which you want the nodes from port A to be in your NODES table but you don't want them to be broadcast to port B.

If you have a working system such as that described above then I would love to know how you set it up! I've tried to set the QUALITY parameter for that port to something like 50 and then the MINQUAL parameter to something a bit less (like 20). So far, that doesn't seem to have done the job.

Thanks!

- Gerry

The only way you can do this is to set the route quality between the two nodes to a low level. If you set the QUALITY to 10 and the MINQUAL to 10 then you should get a situation where the two nodes know about each other but don't pass any other route info. You cn probably set both parameters to a higher (but equal) level if you want both your nodes to propagate past each other.

The setup described is basically how we configure the default settings of nodes in my area - allowed routes are locked in at whatever level while the default quality is set to 10, along with the MINQUAL. This allows people to play with nodes and have access to the network, but nothing they do can cause the network to try and route via them. We are all here to learn by experimentation, and this seems to be a good compromise between having a network which is immune to ad hoc nodes appearing and disappearing, and people playing with node software and learning about the internal workings.

Dave

                          How to Use the WB7TPY
                       Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement.  All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA       -or-
    Internet    : david@stat.com                -or-
    Fidonet     : David Dodell @ 1:114/15

(5) Have fun.  Use the gateway as much as you like.  That is what it is
    there for.

                                  ------
                            From Internet to Packet
                                  ------
```

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address, proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Hi Dave,

That's what I thought. One thing about the QUALITY parameter confuses me though. Does G8BPQ "de-rate" the quality of each individual node (as provided by the broadcast from the node "up-stream") by a given amount?

Lets say that some node sends out a NODES bcast and that a node called MTNTOP has a quality of 40 (as passed to my node in the bcast). If my QUALITY parameter for that port is set to, say 70 will the MTNTOP node (when placed in *MY* nodes table) have a QUALITY of 70? That would seem to defeat the purpose of bcasting a QUALITY. My node should take the bcast quality of 40 and de-reate it to something like 30 or less, shouldn't it?

The reason I ask is that I have tried (before using news) setting the QUALITY of the port to 50 and the MINQUAL to 20. Only a *few* nodes made it through that filter.

Thanks!

- Gerry

I am looking at running a telemetry based packet system to connect the
University to my home. I have queried our Radio Frequency Service
about this, but they queried about the bandwidth taken by packet. I
was allowed something like 20Khz - would this be enough for a 1200 or
even 9600bps link?

Richard

They might also be running packet while the modem is off doing something
else in the background (perhaps even automatic/scheduled stuff like UUCP).
Of course, whether this is the case or not isn't too important.

>it would be safe for bim to have
>this seeming IRQ conflict. Again they will not be competing for the
>interupt, since neither will be used in conjunction with the other.

Yes, but this isn't all there is to it. Let's say the modem and the TNC
are both using IRQ3 (com2 and com4). The modem is inactive, so IRQ3 on
the modem's serial port is basically tied low. Meanwhile, the TNC has
incoming text, and tries to raise IRQ3. This strip on the bus is now
attempting to be at both a +5 VDC and 0 VDC.

Does this sound like a problem? It can be. Sometimes, you get lucky, and it works. I never have...when I've tried this, one serial port works, while the other one isn't recognized by any software I've got, including diagnostics packages. I have heard of cases where boards have even been damaged by attempting to share the same interrupt. In between these two, you have cases where it seems to work ok, but isn't always reliable.

Now, as I mentioned before, there are board/bus combinations that are *DESIGNED* to get around this (the inactive component would be ``floating'' instead of tied low, i.e., tri-state logic). However, unless we know that the person asking the question has this type of hardware, it's fairly safe to assume that they don't (much safer than assuming that they do).

There is a reason why the documentation for so many devices tells you that no two devices may share the same interrupt. Besides, it's much simpler (until you have as many external devices as people like me have!) to just re-think your interrupt usage, and come up with a better combination that allows more devices. I have all of the following in use right now, and am not using any of the higher interrupts (above IRQ7):

```
   serial port on com1 --- IRQ4
   serial port on com2 --- IRQ3
   bus mouse           --- IRQ5  \____  These two might be reversed....
   soundblaster        --- IRQ7  /      I'd have to check my log
   printer port        --- not using an interrupt
   IRQ2 and IRQ6 are reserved
```

I have a patch-panel sort of setup (using simple DB-25 cables) here that allows me to re-configure the setup of the two serial ports, such that any of the following devices can easily be setup to use either serial port:

```
   US Robotics Dual Standard (V.32bis/HST)
   Kantronics All Mode
   MFJ 1274
   null modem (for testing between serial ports)
   serial mouse (no longer in use...)
```

The modem is normally on com1 (com1 is the only one with a 16550), and the KAM is normally on com2.

All this, with only the lower interrupts...and if I wanted to, I could have the modem running a UUCP connect, have something accessing the TNC (perhaps running SLIP or something), have the soundblaster playing some stupid sound file, music, etc., use the mouse for cut/paste between virtual consoles, and have something going to the printer...all at the same time. (In fact, at one point, when I was compiling/testing a bunch of stuff under Linux, I did something like this---I was compiling lots of programs at the same time in different virtual consoles.) Of course, having all of that going at once assumes a multi-tasking OS (or perhaps even Desqview could handle it?)....

>even 9600bps link?

Yes. Both the original 1200 baud modems and the newer 9600 baud modems
available for standard packet TNCs will work in an ordinary NBFM voice
channel. Note that packet is normally half duplex. Full duplex operation
will require two channels.

---------- H A M I L T O N ----------
11 July 1993

This is a weekly unofficial bulletin of news and views from ZL amateurs. It does not represent any official viewpoint, and all opinions are those of the contributor.

Baycom Manual Assistance

---------- from ZL3CS.

'A Little Baycom Software Guide' appeared on the PBBS recently. You cannot really believe the title. It is not a ''little'' guide. It is a large one with over 20 pages of most useful assistance to those who have found the literal english translation of the original text, a trifle difficult to follow in places. This guide to baycom explains the operational parameters clearly, and in simple terms, easy to follow and understand.

It was most pleasing to see the files appear on the local BBS, timed to perfection, coinciding with the July Break-In articles. Ulrich, ZL1DDL is to be congratulated for producing this beautifully prepared group of files of information about Baycom, in response to many requests. In addition to the operational parameters, there are sections on standard texts, file transfers, remote control and password access, and monitor functions. In a

note to all the PBBS sysops, ulrich indicates that he would appreciate their putting these information files into their baycom file directories. Ulrich intends to update them, when necessary.
In no way, does the writer intend, or imply, any criticism whatsoever of the original baycom manual translation.
73 de Guthrie.

Mouse Fuzz Balls
---------- from ZL1ACS
It is said that your mouse maybe suffering from fuzz balls, if it is behaving erratically. The operation called for requires flipping him upside down and removing the retaining ring that holds the ball in place.
The surgery is to remove the ball and clean it with soap and water, then let it dry thoroughly. Check inside the mouse for fuzz balls or other foreign matter and clean it out, but don't use water or other liquids on his insides, or the poor thing will turn his toes up.
73 De Ken ZL1ACS

ZL1AMW Travels
---------- From ZL1AMW
Last week's news was prepared in some what of a rush, and my apologies to those who read this on the Packet BBS, as I managed to slip up with the upload to the BBS, until Thursday. I guess my excuse must be lack of practice, as I have again been out of the country for a few weeks, working in California. Thanks once again to Douglas, ZL1AVY and Guthrie, ZL3CS for once more jumping willingly into the breach while I was struggling in the more temperate climates (around 38 degrees most days!), thinking of all those in the ZL winter, thank goodness for the standard air conditioning in factories and hotels in that area, although the

effect on the body while moving from one building to another are extreme.
Unfortunately I was away for NZART Conference, but was pleased to hear news of how successful it was, once again a great forum for the continued advancement of our hobby.
My 40 metre RTTY Selcal was left on-air again, with some attention from local supporters, but managed to knot itself up for about a

week, all back again on 27 June. Anyone interested in this device can call it up on 7045KHz (mark tone frequency, dial 7047.13 for most modems), and call ZL1AMW in baudot at 75 baud.

That concludes the Data News for this week, this sheet is Prepared at the shack of ZL1AMW from contributions sent by post, RTTY and packet. Text is also obtained from packet BBS stations, and Selcals on 7045/3545khz.
This news is transmitted weekly on Sunday mornings at 0930hrs (local) and repeated at 1900hrs. Both transmissions are on 7045khz. It is first sent in Baudot at 75 baud, then repeated in AMTOR mode B (FEC) on both occasions.
73 to all from Alan, ZL1AMW, 20 Lorne St., Hamilton.

--- End of message #2934 to NEWS from ZL1AMW ---

...and that was the ZLDATA NEWS for 11JULY1993 as received by Carl ZL1UWV @ ZL1AB...

Howdy!

I'm studying codeless tech for the purposes of setting up a packet link to overcome the tremendous long distance phone charges from home to this BBS (about 1.5 hour away by car - 50 miles as crow flies).

First, is such an application legal?

Second, I know 1200 baud is packet max but under what conditions may
``experiemental'' radio use higher baud? (The BBS has 14.4K)
Third, what equipment should I buy for both ends?

Thanks.

I (Ryuji) said:
|: In RF 2802 or 2402, IQ input pins are connected to DBM simply via
|: differential amplifier for each.

RF-2802 and 2402 (RF MICRO DEVICES) are monolithic IC packed into
14-pin SOIC. They inside have two sets of DBMs and
base band differential amplifiers to drive them, and even a phase
splitter (into +45 deg. and -45 deg.). This phase splitter seems
to work in broad frequency, and data sheet (but preliminary release)
says amplitude balance and phase accuracy are excellent.
The method to split phase, not mentioned in this sheet,
is very interesting.

These works at a 5V supplying and in frequency 800MHz-1GHz
(RF-2402) or 20MHz-250MHz(RF2802). Base band is allowed up to 50MHz
and accepted in high resistance(3000 ohm).
Local input port has also high impedance (200 ohm or more).
And, carrier suppression is 40dB.

In Japan, because 900MHz band is not for amateur but CB, these cannot
work directly in any UHF amateur bands.
I also have some other product infomation of the same company for

various use.

In article <C9usp1.ACF@srgenprp.sr.hp.com>
     glenne@sr.hp.com (Glenn Elmore) writes:

 | I've had good luck using differential ECL logic (10116 variety) to
 |drive DBMs directly. They have adequate current capability along with
 |good balance and speed. I've used this to direct sequence modulate a
 |variety of Schottkey diode mixers. I am interested if you have a good
 |and simple discrete transistor design though.

I think the suitable driver depends on frequency. In much higher,
using ECL must be one of better solution. Within HF or early VHF,
more cheap ways will be usable. I suppose complementary push-pull
emitter follower works well.
What replaced its both transistors with inverted darlington amplifiers,
as known as diamond circuit, you can find this as output stage
inside high speed OPamp IC such as HA2539 or AD797, works well
with higher-impedance input source and in a bit slower frequency.
(problems is pnp transistor generally works slower than npn.)

 | So far, my main use for the I/Q modulation capability has been to
 |generate a SSB pilot tone(above the data). The system I'm building
 |phase locks on a pilot tone in order to be able to do coherent
 |detection. To date, I've only modulated data on both mixers together
 |rather than making use of the full I/Q capability. Because I'm choosing
 |channel coding with no DC component, the spectrum near the carrier is
 |free for other uses. It seems that a simple 90 degree audio hybrid
 |would give a coherent SSB audio channel as well, almost for free. I
 |haven't decided what to use it for yet though (:>)

This is very interesting. We are thinking voice application, too.
(But over TCP/IP.) I will introduce yours to my fellows.

I am thanking for your description. I will try to get the papers and
books you pointed.

  I said:
 |: Will you tell me some books suitable for it?
 |: (Books published with the company that have the office in Japan,
 |: such as McGraw-Hill or Prentice Hall, must be easy to buy.)

I recieved a mail asking about the books I use.
Unfortunately, I use only written by Japanese in this field (apart
from SS) as opposed to the field of semiconductor devices or softwares.

The book related to SS and I am reading is:
  R.C.DIXON Spread Spectrum Systems
However I heard of this out of print, translation of this is famous
in Japan.

(In Japan, many foreign software books are translated and we use
foreign terms as it is. But in field of radio communication,

number of translation is much less as far as I know and
we usually use terms in Japanese language.)

 | I haven't focussed much on channel coding yet. I've tried BPSK but I
 |agree that QPSK could be a good addition and inexpensive chips to
 |perform this would be great. If you have literature, or can point me
 |toward some, I'd like to take a look at these parts. Hopefully they
 |are available outside of Japan.

I explained in previous article <86b.6414@jf7wex.sdj.miyagi.prug.or.jp>
in short. I waiting to arrive data book, description I have now
is only part number, block diagram, pin connection and packages.

QPSK demod. chips

All listed here come from TOSHIBA.

For satellite broadcasting (2.048Mbps):
TA7782N two voltage supplying (5V, 10V) is requied
TB1202N single voltage supplying (5V), 1/10 inch pitch DIP
TB1202F the same as above, flat package

For NICAM(728Kbps? 768Kbps?):
TA8662N similar to TA7782N except for lower speed

Some more chips exist. But because of highly integrated, They are
exclusive to construct broadcasting recievers. They have PCM decoder,
digital filter, digital de-emphasis, D/A,... and insufficient pins
for our use.

At least, in Japan, 48kHz 16-bit PCM audio comes down from the satellite,
using 2.048Mbps QPSK on sub-carrier. Is the same format used
in your area?

I am looking forward to your success and obtaining good chips and
good result.
PRUG consists of a few members who have RF experience and many ones
good at computer hardware or software. I wish to work more hard
for building RF part of packet equipment, but regretably
I must learn much hard in order to pass entrance exam to
a university at the beginning of the next year.

I recieved some mails at zao.gw.tohoku.ac.jp, but my machine
in my apartment cannot intercahange mails directly with foreign site now.
If there is a mailing list at the site which can abroad, mainly for
exchanging infomation, do you think it valuable? what do you expect
of it?
I am hoping to do on this group rather than mail if possible...

73

You can run 9600bps through a 20kHz bandwidth - investigate such things as
the K9NG and G3RUH modems and even the new FX489 modem chip (from CML in the
UK but I understand it is differnt in the US - the chip is used in the
DRSI 9600baud TNC)

Hi, excuse my ignorance of the issues please, I'm still struggling with
the FAQ's, and time, as usual, is a scarce commodity.

I'm working on some military sites with some 9600 baud radio modems.
We've done some SLIP connections between two machines, so point to point
works. We want to do packet radio stuff (i.e., Ethernet without the wire)
and I'm now teaching myself about AX.25 and TCP/IP. We run in a Unix
environment, and here's the questions:

1) I know there's KA9Q NOS for Unix boxes, but does anybody make a
commercial version for Unix boxes that will achieve the same thing, or
better with more features? Basically, we want to add AX.25 as just another
network interface like a SLIP or PPP connection, and it would be a boon
to just buy a supported package instead of compiling and debugging KA9Q.

2) We want to test this stuff in-house. Basically we would like to set up
a few radio modems to communicate with some machines in the same room.
Does anybody make a radio modem for short-range networking, and what's
the policy regarding them (i.e., something where we don't have to deal
with the FCC too much).

Thanks, again, excuse my ignorance. I realize this is more of a
professional's question in a hobbyist's group, but I couldn't find a
comp.radio.pro.packet. :)

Besides, you wouldn't believe how many so-called military "experts" have
told me lately "TCP/IP packets over radio, impossible!" ;)

Any suggestions welcome.

Andy Micone

I'm trying to get PA0GRI's NOS (NOSVIEW) running with a Tigertronics Baycom modem (TCM3105) and a laptop (xt) or 386. NO LUCK. Directories were unzipped OK with -d option, I THINK I'm set up, and I have been able to at least decode AX25 on the laptop. NOTHING on the 386 on com1 OR com2.

Baycom 1.4 works OK, however.

Any ideas? Has anyone got NOS working with a Baycom-type modem? ANy local contacts I can call?
Thanks,
Jeffrey Weiss N0IRR

I already replied to you via email, but perhaps this is something that can be pass along to others. If you put your TNC in transparent mode, you can put pretty much whatever you like on top of AX.25 - uucp, slip, whatever. It's not the most efficient, but it saves writing drivers and software, and it easily interfaces with existing serial protocols.

I'm writing this on a 386 notebook computer, linked with a 486/25 via two KPC-3 TNC's, an Icom P2AT HT and an Alinco DR-590 dual band radio. Linked via uucp.

Hi Gerry,

Let me quote to you out of the book:

"For each destination node listed in the broadcast, an indirect route
is assumed to exist via the node who originated the broadcast.

The quality of this route is calculated combining the BROADCAST QUALITY
with the CHANNEL QUALITY parameter appropriate to the channel over which
the broadcast was received.   The qualities are multiplied, normalized,
and rounded as shown in the following formula:"

$$\text{Route Quality} = \frac{(\text{broadcast quality} \times \text{channel quality} + 128}{256}$$

Thus what quality a node has and whether it appears on your list is a
function of YOUR PORT quality and the quality your NEIGHBOR says it has
assigned for the node your NEIGHBOR IS HEARING!

A typical trick is to lower your PORT or HDLC quality to something around
say 112, and then have a MIN QUAL to BROADCAST of say 108.   This means that
all nodes you hear DIRECTLY will have a quality of 112. The above formula
does not come into play until you start dealing with what your NEIGHBOR hears
and what of THAT you want to appear on your node list.

The answer here is to then LOCK (manually enter and end with a !) the route
quality to KNOWN GOOD NEIGHBORS!

Now what defines a "known good neighbor". Is it that you have a solid radio
link to the guy? Yes.. that's true, or should be true, but it is not the
end-all, do-all that the book tries to imply. Another consideration is
DO YOU TRUST THE LIST THAT YOUR NEIGHBOR SAYS IT CAN GET TO????? This is
the most IMPORTANT factor in assigning a manual route quality to a neighbor
node!

I.E. Let's say that you had a PORT (or HDLC) QUALITY of 112, and a MINQUAL

to BROADCAST of 108, but then you MANUALLY entered a route quality to your neighbor of 192! This would in effect cause a lot of the nodes that your neighbor HEARD to appear on YOUR list, and not only that, what your NEIGHBORS NEIGHBOR HEARD TOO! By twiddling this manual ROUTE QUALITY for the specific neighbor node UP and DOWN in value, (while leaving PORT QUAL set low) you can then adjust whether you want to hear just what your neighbor is hearing DIRECT or what your neighbors NEIGHBOR hears too!

The good thing is that by doing this, you will not pass on nodes that you hear during a bandopening! Remember, all the nodes you hear then will have the PORT (HDLC) quality of 112 and although they WILL be broadcast, your neighbor node sysop has a WIDE variation on what you have told him is "known good" and what you just happened to hear because the band was open. This is known as "route locking" and is the best way to go about setting up node automatic adaptive routing.

It prevents your node from using a path to a node that was heard on a band opening, rather than a node that you know works ALL the time!

Twiddling with the default PORT (HDLC) QUALITY and MIN TO BROADCAST (also sometimes called MIN TO UPDATE.. as in..... "appear on your node list") affects EVERY NODE BROADCAST HEARD. Pick a starting point and then adjust your MANUAL route assignments to get what you want.

Remember, as long as your node has a PORT (HDLC) QUALITY higher than your MIN to UPDATE, then it WILL send a node broadcast including all those nodes! Where you set the numbers to will influence whether your neighbor LISTS them, but not whether you BROADCAST them!

If you want to limit BROADCAST SIZE, then simply have a PORT (HDLC) QUALITY *LOWER* than MINQUAL! This will stop your node from passing on ANY info it hears from ANYONE else except it's own identity. If you want to pass on known good routes only.. do the above and then simply MANUALLY lock the ROUTE QUALITY of SPECIFIC NEIGHBORS to a HIGHER number than MINQUAL!

This method will stop BROADCASTS of ALL band opening nodes.. they will not appear on your node list, and they will not be broadcast to your neighbors. Pretty drastic action though.

Remember, ROUTE LOCKING is *NOT* the same as *NODE LOCKING*. If you manually lock a route quality, it will not broadcast the existence of that node should it go away.. if you have locked the route quality and your neighbor node bites the dust, your node will know it, will not route to it, and will not broadcast its existence.

Judging from what appears on most node lists, the above is the least understood aspect of a node by most sysops... it is confusing but once you lower PORT QUAL and MINQUAL and then manually LOCK neighbors to a higher value and watch what happens, you'll get the hang of it quickly.

What I don't like about BPQ code is that apparently you can NOT lock a ROUTE QUALITY to a SPECIFIC NODE *LOWER* than PORT QUALITY *IF* the BPQ node is also hearing it DIRECTLY! This is a flaw in the code since

it does not allow a sysop to lock one nodes total broadcasts OUT of your
node. Regular "TheNet and NET/ROM" nodes allow this.

Best of luck.. sorry for the length.. but it's hard to say in a few
words with any real luck of getting the meaning across.

Hi Everyone,

Were hoping to upgrade the TCP/IP activity in my area (Madison,WI)
from 2400 baud on 2 meters to 9600+ baud on 70 cm.I would like
to know where to buy those 2 watt tekk data radios so people can
easily get on the air. I would also like to know if anybody has
successfully interfaced a 9600 baud modem with a soft TNC program
on a PC or Mac? Any other suggestions about other plug and play
9600 baud systems would be welcome.

Thanks, Reid Savage

A friend of mine has a PK-88 and we would like to know what
experience people have had at running it with 9600 baud modems?

He read some stuff from the manual to me over the phone which
seemed to indicate the the TNC was capable of 19.2k baud, at
least between the TNC and the computer. Any comments would be
appreciated.

Thanks, Reid Savage N9SYW

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to add the groups created during the latest reorganization vote and the description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping

gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common

two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations.

The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I use a PK88 with a 19.2KB data rate between the computer and the

TNC every day of the year. 1200 baud is the limit of TNC to Radio
though. Strange how the more expensive and more useful PK232's are
still limited to 9600 baud TNC<-->Computer.

The TNC, using the internal AM7910 modem, is limited to 1200 baud

operation, but the TNC will send packet data at 9600 baud to an
external modem.

Hello,

I am a Greek postgraduate student at a UK university finishing this
September. Being a research student I had always access (for free) to
the internet for e-mail, news, ftp, telnet etc... Now my question is:
How I can get a connection to the internet (cheaply) from my home
address back in Greece? After some lengthy conversations with some
experts in the department I was advised to look at the packet radio
connections. I do not know much of that stuff but I do know how to set
up a link when a dedicated line is available. Can you please shed some
light on the following questions:

Given that I have the licence to set up an amateur radio
transmitter/receiver and the equipment how I can get a connection and
with whom? Are there packet radio internet nodes in Greece?

What are the maximum speeds I can achieve with a packet radio
connection? Is it faster than the speed of a 14400b modem? Can I
receive most of the main internet services i.e. e-mail/news/ftp? Is it
a 24H connection?

Are there experts in Greece that are willing to help / share
experiences? (BTW: I live in Athens).

Thank you,
George.

Thanks for the responces about MPF102 replacement...
I am posting a (usefull I think) summary.

73 de George (SV3CHA)

****

Hi, George...If memory serves me, I believe the 2N4416 is a suitable
drop-in replacement for the MPF102. The QST "Ugly Weekender" project
from a decade or so ago uses the 2N4416 in the VFO (if I am recalling
correctly); seems like the article noted that an MPF102 could be used
instead, but the VFO output would be reduced somewhat.

This is all from memory--I don't have the article in front of me.
Sorry...
73 de aa0ms

****

I'm a bit baffled by your request. The MPF102 is by far the most
commonly available VHF JFET, at least here in the States. There are
lots of second sources; it certainly doesn't have to come from Motorola.

Are you having trouble finding it, or are you looking for a similar
part for some other application? Most MPF102 applications will work
with any small-signal JFET with Ft above 500 MHz or so.

73 de ke9tv/2, Kevin KENNY GE Corporate R&D, Niskayuna, New York, USA

****

Almost any jfet will work.

Even the pack of 10 on a card from 'rat shit shack' will usually work
as an mpf102.

Most of them are good to about 10 mhz, but you need to check the biasing
resistor on each and every one, since tolerances are HUGE.

Bob

****

Hi...I was able to get them from Radio Shack! I also got a replacement...
I'll try to look up the number in my handbook tonight.

Anyway, after I got a replacement part from a mail-order place, I found
one in a Radio Shack in Santa Fe. It is a standard stock item....

-Tom
KJ5LT

****

The MPF102 was the "economy" version of an RF N-Channel J-FET, as I recall.
 I've searched my Motorola literature, and can find no reference to it any
more recent than 1974.

A better transistor of that generation, that is still available, is the
2N4416A. It is in a metal can instead of the plastic case, and has higher
gain than the MPF102. Another transistor that may be useful is the 2N3821.
 I'm not familiar with it, but it is listed along with the 2N4416A, in the
1992 issue of the Motorola "Master Selection Guide".

73, Fred, K4DII
****

The 2N4416 is similar and more tightly specified. It's a good replacement
choice.

Roy Lewallen, W7EL

****

Well, you could try using a ... MPF102! They are easily found, and currently
manufacturered. Check Digi-key, or Jameco, or Mouser, or DC Electronics,
or... you get the idea. You might even be able to still get them from
Radio Shark.

73,

Chuck Harris - WA3UQV

chuck@eng.umd.edu

****

Gee, I haven't had any trouble finding it until now.

Anyway, it depends some on the application. Devices with similar specs
include:

2N5457-2N5459   (VHF)
2N5484-2N5486   (general purpose)
2N4416   (RF)
J308-J310
NTE/ECG 451-452

No guarantees that any of them will be a plug-in direct replacement in any
given application, but some creative reading of the specs should allow you to
adapt the circuit.

Some of these have a higher gain-bandwidth product than the MPF102, so you may
need to add some impedance to the gate lead to suppress VHF/UHF parasitics,
depending on the circuit layout.

73 de ke9tv/2, Kevin

****

The NTE replacement for the MPF-102 is the NTE451;
J Fet N-Ch. VHF/UHF amp, TO92
Cheers;
Howard Anders

I'd like to know if anyone has augmented the KA9Q Internet package by
adding SNMP, the Simple Network Managagement Protocol?

(E-mail responses preferred, I will summarize to the net.)

    Thanks / JBL

    > This is very interesting. Is there any more info available,
    > anyone?

I recall reading during Desert Storm about TNCs running AX.25 that were used by
the military in SAudi Arabia. Perhaps AEA made these?

Think about the open market price for a TNC versus, say, those $600 toilet seats
the Pentagon acquired a few years ago. Perhaps TAPR should look into defense
contracting?! ;-)

Hi. I am asking these questions on the behalf of a friend. He is interested in establishing a communications link between his church and a mission which they support in Guinea, Africa. Phone links are not an option...

- Is this feasible with packet radio?

- What are the costs involved?

- Can the equipment be easily run and maintened by a non-specialist in a place where spare parts will be hard to find? Also consider the other conditions in the area (power is coming off portable generators, for example).

- Both voice and data (laptop to pc) communication is desired. Either one will do for the time being.

- Can you recommend something else if packet radio is not usable for this task?

Thanks.

(Please email replies to mpoly@panix.com)

Hi!!

I have downloaded the KA9q files along with the nos.... files
from ucsd.edu.

In the nosvw137.zip only the executable file of BM (i.e. BM.EXE) is
available.

Can anyone who has used it tell me where I can get the source code of
BM as well as for the other executable files like ELM.EXE.

Can someone tell me where I can get the installation documents for ka9q.

Thanks in advance.

Sudhakar

I have set up ka9q-nos here and am having a problem. I have not found any
information that will tell me how to set up a modem to answer under NOS. I
have attached it as an asynchronous device, can dial out, but have not found
any information allow it to answer a dial in.

Any help would be appreciated. Please reply directly to me bmc@magstim.njit.edu

I just recently passed my novice and tech. exams. I purchased a 2 meter HT,
and now I'm interested in linking it to my computer (386sx).

1. What information (or advice) could you give about starting a packet station.

2. What kind of TNC would you suggest to a beginner?

3. Do you have one you're willing to sell?

Yes, you can do packet on just about any HT.

More specific to your question....Yes. I presently do packet using the
Yaese FT-530. Someday, I'll afford to get a seperate radio for packet, but
in the meantime I use the HT.

Actually, I'm trying to figure out this NOS stuff.

Live within range of a digipeater, node, or bbs. This will
enable you to send mail. There should be plenty around Milwaukee.

>2. What kind of TNC would you suggest to a beginner?

It depends on what you want to do. If you want to go straight packet, go for the MFJ-1270B or the PK88. You get more modes and options in the MFJ-1278 and PK232(MBX). This answer will probably create a thread of flames and responses to which is better, the MFJ, or the AEA (PK*). I have an MFJ-1278 and prefer it to the AEA. There is also an MFJ-1274. I'm not sure of all of its functions, but I'll at least mention it. You'll find many brands of TNCs, but MFJ and AEA seem to be the most popular of the brands.

>3. Do you have one you're willing to sell?

Sorry, but you can usually find them cheap at Flea Markets ot HamFests. Get in touch there with some hams. They can point you in the right direction.

What kind of equipment is needed to build & tune a Ramsey 146? Basically, is this a kit you can solder together and go, or do yuo need an oscilliscope, freq meter, swr meter, etc to have it working right? I was thinking of building it and listening while I work on my license, then using the xmit side. Good idea, or should I go commercial for a first rig?
 Also, how does it work with packet?

Thanks for the pointers,

dave.

That's the 2m receiver isn't it? I built one last weekend, and it went pretty
well. (BTW, I have years of experience in digital electronics, but this was my
first VHF radio, and my first alignment job).

>is this a kit you can solder together and go, or do yuo need an

Not bad to assemble. 3 chips (NE602 (1st mixer/osc) , MC3359 (2nd mixer/osc/IF
strip), LM386 (Audio amp)), 4 transistors (RF amp, 1st IF amp, AFC,
stabiliser), and about 60 passives. Varactor tuning.

>oscilliscope, freq meter, swr meter, etc to have it working right? I was

Well, you certainly don't need an SWR meter for a receiver. The frequency
counter (if it covers 10.7Mhz higher than the desired frequency i.e. 154.7 MHz)
would be useful to set up the 1st osc (This is a dual superhet design, the 1st
osc beats the signal down to 10.7Mhz, and then the 2nd to 455kHz). The second
Osc is a xtal, and both IFs are ceramic filters, so there is no alignment
there. I used my 'scope (Tekky 555 with 1S1 plug-in) which has a 1GHz sampling
input, but I didn't really need it.

The instructions suggest finding a local Ham to transmit a test signal to you

and then tuning to receive it. That would work. Simply tuning the coil until
you hear the local repeater (or digipeater) works also.

>thinking of building it and listening while I work on my license, then

I have my license, but no equipment. I think this should be a good start for
repeater/packet working.

>using the xmit side. Good idea, or should I go commercial for a first rig?
> Also, how does it work with packet?

Not tried it yet, but I can certainly hear the local digipeater. I need a
better aerial (I have a couple of bits of wire as a dipole) before I have any
hope of decoding it, but it sounds possible

I think commercial equipment is outside the spirit of amateur radio. I'm going
to home-brew everything!.

There have been a few messages recently about how to make a 6-meter
handheld, given that the commercial choices are either expensive or less
than wonderful. Assuming that the Ramsey 6-meter transceiver is the same
size as the 2-meter, do you think it would be possible to make a 6-meter
HT from a Ramsey kit? Is it small enough and durable enough?

Can anyone post information on the relative popularity
of the various systems being used in amateur packet radio?

ARRL's "Your Gateway to Packet Radio" lists several including:
digipeaters, NET/ROM, KA-Node, TexNet, and TCP/IP. To me, TCP/IP
seems the obvious choice, but is it? What's really happening
out there? My copy of "Gateway" dates from 1989. Probably lots
of water over the dam since then :-). What's happening
currently?

Thanks,
jim

A RF signal generator with FM modulation that will go down to a fraction
of a microvolt is very handy for peaking up the receiver.

This is assuming that all goes ok. If you have problems, like I did,
you will definitely need Maalox or Rolaids - your choice.

Almost everyone that has built these has had to tweak the coils -
spread them out and so on. In addition, I had an incomplete kit that took
two tries and 6 weeks to correct, bad crystals (wrong load pf),
and blown first mixer (shipped without protective ring). It took quite
a while to get it to put out 6w and have adequate receiver performance.

>thinking of building it and listening while I work on my license, then
>using the xmit side. Good idea, or should I go commercial for a first rig?
> Also, how does it work with packet?

The positives:
  I learnt how to work with a 2m tranceiver and get it to work.
  I learnt to find bad components: mixers and crystals.

The negative:
  Cost. With enclosure it cost $176 + shipping.
  Also consider the competition.
  You can buy a brand new Alinco DR1200 for $225. (or a used one for
  $175). It comes with display, zillions of channels, pl encode/decode,
  25W and is much smaller. (DTMF Mic is extra - $33).
  I think that $100 with a case, mic and PL would be a fair price for the
  Ramsey. As it is, it does not include a mic, PL or DTMF. Plus
  it has to built with somewhat cheesy components.

Take your pick and best of luck.

To anyone,
  We are working here at Princeton on a project to put low-cost seismometers in high schools. So far we have the seismometers, but accurate timing is still lacking. I have heard of obtaining accurate time over Internet, by syncing a local computer clock with a network standard, but this apparently exists only for Macs and UNIX systems. Am I wrong? If anyone knows of this timing technique being adapted for PC's (specifically we are using Radio Shack Tandy 2500 SX/33's), please let me know soon. Thank you.

 It was suggested to me that I post this request to this group. Someone told me that someone on this group would know about the KA9Q package that would allow accurate network time for PC's. What is this KA9Q package, and where can I get it?

Also, we are also interested in receiving radio time signals to feed into an A-D board on our PC's. Does anyone know of a CHEAP receiver that can be either purchased or built that will receive WWV or a Canadian time signal? We have bought a short-wave receiver , but the cost is rather higher than we wanted for the high schools project ($120). Any information would be appreciated.

Thanks,

Bob Clouser

There are several programs that will allow a PC's clock to be set via modem
from the NIST time standard. It's quite accuate.

I am interested to convey a sense of what can be done using
packet radio in emergency and disaster situations to people
in the Office of Foreign Disaster Assistance.

Often this office is called upon to assist in disasters in
countries where there is not good TC infrastructure to begin
with, and it seems to me that packet radio could and should
play an important role in such situations.

Anybody got any stories? local, domestic, or foreign? Any
pointers to where I can ask more?

And one other thing. Anybody have any experience linking
packet radio network systems to dial-up networks like
Fidonet technology systems?

Will sure appreciate this community's responses.

jim

Does anyone know what the status of AMSAT OSCAR 17, aka DOVE
is? The information I have indicates that it can be heard
on 145.825 MHz without special equipment other than a 2-meter
ground plane antenna and a AX.25 compatible TNC.

The Track-21 software that I am using indicated a pass over
my area (Chicago) on July 19th at 04:41 UTC. I was unable to
hear the satellite on 145.825.

Pete:

     I haven't heard lately but I'm pretty sure the 2M transmitter on
DOVE was disabled due to some failure. I believe the S-band transmitter is
working, though.

It's too bad, too. In the past, when I just started to listen to the birds,
DOVE was one of the first I copied - I used to copy the telemetry and
attempt to decode it.

         --chas, WB0LJP

ps: If you haven't subscribed yet, I would urge you to join AMSAT. Their
AMSAT Journal is full of great articles, they are very willing to help, and
they need the continued support of hams like us to keep putting birds up
and providing the research and support for all areas of space
communications. Also, for packet work through the birds, TAPR has a bunch
of good articles and kits for PSK modems, 9600 baud modems, TNC's, etc.
Their Packet Status Register is a good source for interfacing tips, etc.

This is not a paid announcement - I'm just a generally satisfied member of
both organizations and am thankful that they exist.

Yes, I have a TAPR 9600 baud modem in one of my pk88's. It works.

I've gotten some recent mail about Desqview multi-tasking software for
PC's... a 286 version for $80 and a 386 version for $130. Desqview is
not a point-and-click GUI like Windows, but its multi-tasking is faster.

I have found that Poor Man's Packet won't run on my 20MHz 386sx under
Windows 3.1, and I am trying to find out if anybody is running Baycom
or PMP using Desqview as a multi-tasker. How well does it work?

(A local BBS in town uses Desqview as a part of running the F6FBBs BBS
and I think that he (Jim) would swear by it... N9LNQ @ N9LNQ.IL)

Thanks in advance for responses and comments.

Yes. -- I have done precisely this for several years. The NE1000 driver is
contained in the Russ Nelson Packet Driver set. Follow the instructions
for installing the packet driver in the docs for the driver set and for
NOS.

The DRSI driver in NOS is somewhat brain-dead... I use the generic SCC
driver coded into NOS which seems to work just fine. Again, the NOS docs
are just fine and describe how to set up both channels of the DRSI cards.

Jack.

Hi there

I am interested in a effiecient way of implementing a transmitter for a 9600
baud modem that operates the same way as the G3RUH. The G3RUH modem uses a

EPROM in the transmitter and I don't want that.

I am looking for a similar method of implementing a transmitter for PAM (
pulse amplitude modulation) without using a EPROM.

Any information or references would be appreciated.

It's pledge month(s?) for the rec.radio.amateur.digital.misc FAQ. With the creation of this new newsgroup, I will be needing some input to add coverage for the other digital modes, i.e. RTTY, AMTOR, PacTOR, CLOVER, digital voice, and so forth. If you have information on any of these areas that you think would be helpful to other hams, please send it to digital-faq@Wattres.SJ.CA.US.

Thanks, and back to your regularly scheduled program.
****

The Packet Radio FAQ list will be posted on a monthly basis to rec.radio.amateur.packet and rec.radio.amateur.digital.misc. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for

commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay

League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways

and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

```
telnet knuth.mtsu.edu 372

    or

telnet 161.45.1.1 372
```

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

There appears to be a mailing list about NOS on hydra.carleton.ca, but I don't have much more detail. Send a message to nos-bbs-request@hydra.carleton.ca. The list name is nos-bbs@hydra.carelton.ca.

2.2 What anonymous FTP sites and electronic mail servers are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.
(I have one report (from George Hitz, W1DA) that this FTP site will be down until the end of this summer, 1993. Reportedly the site admin is going to be in Sweden.)

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

As for mail servers, there is only one that I know of at the moment:

Ham-Server@GRAFex.Cupertino.CA.US

This mail server, which is run by Steve Harding (KA6ETB), has a wide variety of information on most aspects of amateur radio, not just digital modes. Send a message with the body HELP to get a fairly useful listing. Also note that Steve posts the index from the server approximately weekly

to rec.radio.amateur.misc, rec.radio.amateur.packet, and sbay.hams.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateways

There are currently two comprehensive gateways between the Internet and the packet radio BBS system. One is run by Jim Durham, W2XO, in Pennysylvania and the other, which allows access to PBBS bulletins, as well as mail, is run by Bob Arasmith, N0ARY, in California.

2.4.1 The W2XO Gateway

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

2.4.2 The N0ARY Internet mail <-> full packet BBS gateway

Bob Arasmith, N0ARY, runs a gateway between the Internet mail system and PBBS system. His gateway allows you to read, post, and respond to other postings on the PBBS system via email. For more information, send mail to gateway_info@arasmith.com.

2.4.3 LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

TCP/IP doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol (called IP) on top of AX.25. This is used to increase efficiency of its transmissions, since IP does not require packets to be "reliable", that is to say, guaranteed delivered error-free. TCP handles the retransmission of lost and garbled packets in its own way, at a higher level. Therefore the extra information in an AX.25 "VC" (virtual circuit) frame is not useful, and thus consuming needed bandwidth.

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are

more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen,

W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS
software to allow full service BBSes to forward mail directly to the
amateur's TNC. This allows operators to receive packet mail at night
and avoid tying up the network during busy hours.

Hi, I just picked up a KPC3 about four weeks ago and was just wondering
if anyone knows of any books and/or anonymous FTP site or have views
on proper etiquette for the packet waves. Most of this stuff I can see
happening to someone out there in packet land. I can't personally say
it's happening to me and I can't say even that some of these things are
important. So please keep flames to a minimum. It's my hobby, I'm not
a "packet cop" or have any desire to run for political office.

  *) How much power is appropriate?

     *) Running 500 watts makes my packet station work much faster,
        at who's expence?

     *) My HT times out all the time, Should I compain to the 1KW
        pbbs/packet-hub/maildrop station operator? Or....should I
        just move to another freq so I can connect to my friends
        station next door! Any Ideas?

     *) Should Packet Operators with junky antennas and low power
        complain?

  *) How often and when to beacon?
     *) Should beeps and other special characters be put in beacons?
     *) Should part time stations beacon? How often?

```
     *) Should mobile stations beacon? How often?
     *) Should full time stations beacon? How often?

  *) When is using an ID is appropriate and how often?
     *) Is more often than what the FCC requires for a
        CW ID a good idea or a bad idea?

  *) Use of Aliases.
  *) Handshake timing.....etc....

  *) Mail.
     *) How often should I forward mail?
     *) How often should I expect someone else to forward my mail?
     *) Using maildrops.

  *) Using packet/internet gateways.

  *) Rules for Digipeating and pbbs'ing
     *) Using someone as a digi while they are having a QSO?
     *) Leaving a message while someone is having a QSO?

  *) Are there any horror stories, or frequent conflicts that
     have happened to anyone while doing packet?
     *) Has anyone experienced any type of storm on packet?
        *) A station stuck keyed down for a long time.
        *) Lots and Lots of mail being forwarded during packet
           QSO prime time?
        *) Lots of stations beaconing every minute?
        *) Packet software stuck in an endless loop?
           *) pacterm has a know bug are there any others?
        *) Packet Hackers?

  *) Has the FCC busted anyone who was using packet?

     *) Has anyone received a notice from the FCC related to packet
        operations?

  *) What defines a *PACKET JERK*?
     (I don't want to become one!) 8^)

Also:
     Are there any plans on adding (more?) packet questions in the
        FCC tests?

Blame me, The comments and mispellings are mine not my companies.

I am trying to get WNOS4a8 going on a NEC Powermate with 2M of memory. I used
to run an older version of NET and decided I would try out the newer stuff. I
tried what a lot of people do and that is using my old Autoexec.net file in
place of the Autoexec.nos file. After reading the documentation I went back and
tried the Autoexec.nos file that came with the WNOS4a8 file that is on
ucsd.edu. It is configured for Europe and tried to use the documentation to
comment out what is not appropriate for my configuration and select what is. I
ran NET on a KISS PK88 TNC and it worked fine. Does someone out there have some

inkling of why I get a scrolling screen full of STACKViolations when running with the Autoexec.nos file and merely a missing Autoexec.nos error message when I run without? It seems to me it is something I have selected in the .NOS file and I suppose without posting what my file contains it will be fairly difficult for you to know what exactly it is ;-)

I'm just after general guidance. What other people have found as causing this problem. I'm a newbie at this so this should be a nice break from some of the indepth conversations I've seen going on here.

As a side question, I sup[pose that once I do get this working I need to become a part of the system to be able to use NNTP?

Thanks folks
__mike

I have not seen any mention of a FAQ...if there is one I apologize for
this unnecessary bandwidth...

How can i get started in packet? what's a good book(s) to get to find out
what i need and how to set it up? can i just buy a tnc (like the packrat)
and hook it up and all the software comes with, including nice instructions?
(hahahahaha!) or am i more on my own?

i realize i need to crawl before i can walk, so what do i do, where can i
go, to help me learn to crawl?

tks

Summary: Is there an NDIS (Windows for Workgroup) interface to the Clarkson pack
Keywords: NDIS Clarkson NOS

I am posting this for a friend who is interested in passing Windows for workgroup
traffic using the Clarkson drivers as an interface in order to run a NOS in
parallel.
The problem is that while NDIS (Windows) will support TCP/IP it will not interface
to the Clarkson driver (or we dont know how to interface). Has anyone tried to use
the Clarkson drivers with NDIS ? or made NDIS compliant drivers ?

Please reply by e-mail to jl@panix.com

Thanks

JL

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to add the groups created during the latest reorganization vote and the description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham

radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The

rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Sometime ago, I heard that people were working on
developing software based TNC's which eliminate the need
for hardware TNC's.
I wonder if there is anything like that in the market now?

Merci.

From: sytex!jim@uunet.uu.net
Subject: Popularity of various PR NOS's
To: packet-radio@ucsd.edu

Can anyone post information on the relative popularity
of the various systems being used in amateur packet radio?

ARRL's "Your Gateway to Packet Radio" lists several including:
digipeaters, NET/ROM, KA-Node, TexNet, and TCP/IP. To me, TCP/IP
seems the obvious choice, but is it? What's really happening
out there? My copy of "Gateway" dates from 1989. Probably lots
of water over the dam since then :-). What's happening
currently?

Thanks,
jim

There have been a few messages recently about how to make a 6-meter
handheld, given that the commercial choices are either expensive or less
than wonderful. Assuming that the Ramsey 6-meter transceiver is the same
size as the 2-meter, do you think it would be possible to make a 6-meter
HT from a Ramsey kit? Is it small enough and durable enough?

To: packet-radio@ucsd.edu

What kind of equipment is needed to build & tune a Ramsey 146? Basically, is this a kit you can solder together and go, or do yuo need an oscilliscope, freq meter, swr meter, etc to have it working right? I was thinking of building it and listening while I work on my license, then using the xmit side. Good idea, or should I go commercial for a first rig? Also, how does it work with packet?

Thanks for the pointers,

dave.

>
>What kind of equipment is needed to build & tune a Ramsey 146? Basically,

That's the 2m receiver isn't it? I built one last weekend, and it went pretty well. (BTW, I have years of experience in digital electronics, but this was my first VHF radio, and my first alignment job).

>is this a kit you can solder together and go, or do yuo need an

Not bad to assemble. 3 chips (NE602 (1st mixer/osc) , MC3359 (2nd mixer/osc/IF strip), LM386 (Audio amp)), 4 transistors (RF amp, 1st IF amp, AFC, stabiliser), and about 60 passives. Varactor tuning.

>oscilliscope, freq meter, swr meter, etc to have it working right? I was

Well, you certainly don't need an SWR meter for a receiver. The frequency counter (if it covers 10.7Mhz higher than the desired frequency i.e. 154.7 MHz) would be useful to set up the 1st osc (This is a dual superhet design, the 1st osc beats the signal down to 10.7Mhz, and then the 2nd to 455kHz). The second Osc is a xtal, and both IFs are ceramic filters, so there is no alignment there. I used my 'scope (Tekky 555 with 1S1 plug-in) which has a 1GHz sampling input, but I didn't really need it.

The instructions suggest finding a local Ham to transmit a test signal to you and then tuning to receive it. That would work. Simply tuning the coil until you hear the local repeater (or digipeater) works also.

>thinking of building it and listening while I work on my license, then

I have my license, but no equipment. I think this should be a good start for repeater/packet working.

>using the xmit side. Good idea, or should I go commercial for a first rig?
> Also, how does it work with packet?

Not tried it yet, but I can certainly hear the local digipeater. I need a better aerial (I have a couple of bits of wire as a dipole) before I have any hope of decoding it, but it sounds possible

I think commercial equipment is outside the spirit of amateur radio. I'm going to home-brew everything!.

>
>Thanks for the pointers,

-tony
BTW, it worked first time!. I'll recomend the kit to others.

MiniSport Laptop Hacker - Vol 4   28 Nov 92

A few more folks checked in since the last issue. It was good to hear from
KI6PL, N8OWM, N8PJP, KU8H. These volumes come out pretty spuratically.
That's why they're labelled Volumes rather than Parts. Each is put out on
the network as I have info to fill it. Be sure to send me *your* informa-
tion! The rumor mill suggests a large pool of these machines is becoming
available in the Michigan area at reasonable prices.   That should provide
a much bigger pool of users to swap information. Good!

One of the best purchases I've made recently is a CD-ROM. I survive with

one Ham radio related disk and one shareware distribution disk. Any of the programs I refer to are likely sourced by these two CD-ROMs. I would love to share them with you, and it's encouraged by the program authors. Make it painless for me (disk SASE, clear request, etc) and I'll make copies for you. If you're a "want it now" type of person, we can do a phone data transfer.

>>> FLOPPY DISK SOURCE The strange 2" floppy disks problem seems to be a perennial concern. Here's all the non-rumor info I have. Rex Television Service Co (7030 W. 111th Street, Worth, IL 60482-1827) sells a 10cnt box for $45.00, but then tacks on another $10 for freight. They also tried to get me for sales tax, but refunded it later. Phone 708-448-5558. The box I have indicates a lifetime warantee from FUJI, with the following Point of Contact: Fuji Photo Film USA, Inc., 555 Taxter Rd, Elmsford, NY 10523.

>>> FILE TRANSFERS I found COMMO and DSZ will work together on the MiniS-port for what I need in less space than PROCOMM takes. This allows packet (or modem comm) with ZMODEM, YMODEM, and XMODEM protocols. I tried using DSZ with a hardwire between computers, using a null modem cable (FWL, which is on your disk C:, is faster. Don't ask why I do these things!). DSZ did not like the 3-wire null cable I described in MLH Vol3 that works with FWL. It needed to "hear" the CD (Carrier Detect) on the serial port. Trying to stay as globally portable as possible, here's a full blown null modem cable that lets you plug into almost any IBM/PC/XT/AT/'286/'386/'486/? that you may come across.

```
 {9fem}--------4' 7cond cable------({9fem}----- 5" 7cond cable----{25male})
-------------------------------------------------------------------------
 0 (0 1)        DB-25 Frame Ground is not used
 1-6 (1-6 8-6)  Each feeds it's received DSR into CD, also
 2-(3-2)        Data to loner
 3-(2-3)        Data from loner
 4-(6-6)        DTR from loner goes to others' DSR
 5-(5-7)        Signal Ground
 6-(4-20)       DSR to loner from others' DTR
 7-(8-5)        RTS from loner to others' CTS
 8-(7-4)        CTS to loner from others' RTS
 9 (9 22)       Ring Indicator not used
```

The numbers to the left are pin numbers. Wires are represented by "-". In the text description, "loner" refers to the computer at the lone connector end.

DSZ supports much more widely-known protocols. For that reason, it has been important for me to get running. It's still in an evaluation stage at this QTH. If you have any experience with this program, I'd be interested. But be assured that Zenith did you well by providing FWL. It is an order of magnitude faster for local hard-line transfers. I've not tested FWL over the phone line.

SWAPPING THE SECOND MEGABYTE
I had two MiniSports. The 2M one had a power supply problem. It would work work for a week or so and then no longer power up. Each time, I took

it apart, wiggled all the connectors, put it back together and it worked.
The fourth time around I decided "enough!"
I unsoldered the single-inline-pins of the add-in memory package (8 bits by
1 Mbyte). I resoldered into the same position in a second machine that was
working reliably as a 1M system. The memory package's pins are not actual-
ly the pins of the ICs, so I wasn't too worried about heat damage. I used
an alligator clip between the soldering iron and the computer ground.
No jumpers, solder traces, etc needed to be modified. I reran the SETUP
option (hold ESC on power up), specified new memory sizes in both, and,
voila!, they both have worked fine now. I'm still waiting for the old 2M
to fail again.

If you have any supply information on 1Mbyte x 8bit SIP (or SIMMs, I'll add
the pins), please let me know! I'm confident that I and other hams can
successfully double the memory in a 1Mbyte version of the MiniSport.

Next time, DISASSEMBLY INSTRUCTIONS, POWER SUPPLY PINOUT, MINIMUM BOOT
FILES, and discussion of BOARD REVISIONS.

I find myself making a case for something I consider to be bad form, but
not illegal:

Alan Bloom (alanb@sr.hp.com) wrote:
: Seems very clear to me it's illegal:

: 97.3 (a)
: (10) Broadcasting.
: Transmissions intended for reception by the general public, either
: direct or relayed.

The fact that a packet is unconnected does not make it intended for
reception by the general public.

Just as a repeater controller giving the time and temperature is not
broadcasting.

: (23) Information bulletin.
: A message directed only to amateur operators consisting solely of
: subject matter of direct interest to the amateur service.

This has nothing to do with it.

: 97.111 (b)
: In addition to one-way transmissions specifically authorized elsewhere
: in this Part, an amateur station may transmit the following types of
: one-way communications:
: ..
: (6) Transmissions necessary to disseminate information bulletins.

Either does this.

: 97.113 (c)
: No station shall transmit communications in order to engage in any form
: of broadcasting, ...

let me finish: "...nor to engage in any activity related to program production or newsgathering for broadcasting purposes. A station may, however, transmit communication to convey news information about an event for dissemination to the public when the following conditions are present:

(1) The information involves the immediate safety of live of individuals or the immediate protection of property;

(2) The information is directly related to the event;

(3) The information cannot be transmitted by any other means because normal communications systems have been disrupted or because there are no communications systems available at the place where the information is originated; and

(4) Other means of communication could not be reasonably provided before or at the time of the event."

Clearly the intent of 97.113(c) is to prohibit an Amateur Radio station from replacing or enhancing public broadcasting facilities -- except in unusual emergencies. A packet bulletin or unconnected "unproto" frame simply does not do this, as it is not intended for reception to the general public [thus not fitting the definition of broadcasting].

Now, let me say this. Amateurs have held a common kinship and bond that is strained by matters of religion or politics. Abortion is both a religious and political issue, both sides feel morally justified in their position and consider the opposing view to be reprehensible. While no government can legislate rules banning such topics, amateurs usually police themselves from creating discussions around issues that foster ill will.

I feel that this is the best approach to solving this problem. Explain to the offending ham about an amateur's responsibility to foster goodwill [see 97.1(e)], and how such issues -- albeit deserving issues -- simply fail to work toward that end.

I'm trying to locate information on how packet radio can be used in a non-amateur-radio (commercial) setting. Are there any educational institutions or businesses which use packet radio for computer service/data delivery?

A librarian at UCSD (I think) used to have some activity, but I haven't heard much lately. I'd be especially interested in organizations which utilized ITFS transmission media/licenses/etc.

Specific application consists of locating computer terminals without using leased phone lines, including mobile and temporary fixed locations.

How does a main-frame handle communications among multiple terminals?

Organization: Packet Radio User's Group (PRUG) Sendai, Miyagi.

Please allow me to write about our plans to experiment high speed digital
communication over radio in Japan.

TNC

We have a type of TNC named "TNC-Z", developed by Masaaki YONEZAWA (JE1WAZ), using HD64180S(HITACHI), dedicated to kiss-mode. It can handle up to 2Mbps differntial Manchester symbol (and NRZ/NRZI) at radio port. Because it aims to be used for multi mode of radio, only a outer MODEM is available. PCB and diagram of TNC-Z have already distributed. Size of PCB is 4 x 3+3/8 (in inch).

FSK

We have already experimented 64Kbps at 1200MHz for several times. At that time, a pair of IC-1200 is used for full-duplex. (It is hard to work for the RIG as both TX and RX concurrently.) The modulation was done directly at the VCO of the TX-RIG, (Because of PLL and not scrambled, we concluded to use that symbol.) and a small external circuit, using MC-3356P(MOTOROLA), which converts IF of IC-1200 (136MHz) below into 10.7MHz, filter it, and shape detected signal, for demodulation was prepared. The book "High-speed Packet TNC" which describes V.27ter, V.29, 64Kbps FSK, and already distributed PCB at that time for them has published with genny.or.jp, but sorry for only Japanaese edition is available.

RF part was further improved to be independent component separately from up-converter. The circuit and PCB, MC-2833P (MOTOROLA) as TX-part, the same 3356P added local osc (crystal controlled) and RF amp in as RX, also including PTT(RTS) control and voltage regulator, had developed by me. This RF PCB will be orderd soon. Size of this PCB is 4+3/4 x 3 (in inch).

No filter was used at that experiments because digital filter was not in time. Now, some prototypes have already built and evaluated. All digital filters had developed by Shin'ichi KANNO, JN1JDZ. He is selecting from among them and turning it to practical use. Odering its PCB is in progress.

PSK (being planned out.)

Some kinds of suitable chip, dedicated to demodulate QPSK, are supplyed for consumer products. A kind is for NICAM, about 750Kbps. (728Kbps or 768Kbps??) Another is for also PCM audio channels of satelite broadcasting, 2.048Mbps. I found chips supplyed from TOSHIBA for each use, and from MICRONAS (Finnish company) for NICAM.

Problem still lies in modulating. I know some groups using looking-up EPROM and D/A, and existence of variously applicable chips, useful for this purpose, from RF MICRO DEVICES.

I think demodulator must be composed cheap and simply, but modulator is up to how construct. In case of using the RF-2802 or 2402, containing 90 degrees hybrid phase splitter and two balanced mixers,

it is easy to do so. And the catalog says "Low Cost".
I am interested in using them. Anyone used? How much did it cost?

Protocol and software
We simultaniously reserch broadcasting-type protocol for scattering
USENET compatible news, amprnet-JA, over radio.

I'm new to packet and don't know how to recognize what is appropriate.
There is a local station that sends unconnected packets with an
occasional message imploring people to pray for and condemn the "slaughter
of the unborn" in a reference to abortion.

Is this sort of thing legal? Does the FCC allow packet braodcasting or look
the other way? The other station contends that since the message isn't
obscene he has a right to send it. Is packet on the regulatory frontier or
do I need a new license manual?
Thanks!

In the UK, that's definitely extremely illegal, the use of amateur radio for
political and religious purposes is expressly forbidden. It damn well should be
in the US as well, but owing to all the flag-wavers shouting 'First Amendment'
all the time and whining about rights, it probably isn't.

Sorry for minor flame, but use of packet for that sort of thing annoys me no
end. That's not what amateur radio is for. It's on the same line as in the UK,
some stations contending that they have a right to send whatever they want over
the network because they have a license - which is of course wrong, as the

wonderful network we have is all courtesy of the operators who allow others to use their equipment. Talking about having a 'right' to do with other people's equipment exactly what you wish, er, also annoys me no end. Ho hum.

Gosh, I am a bad-tempered sod..

I would be very surprised if you leave a valid mail address you don't get a reply.

The gateway operators have no reason not to reply to reasonably made requests.

Well, I am going to assume for the sake of arguement that you are using
COM1 for a mouse or something like that. Now being that you are using an
internal modem, there should be some jumpers on it to switch the com
port. What you will want to do is switch it to com 4 (because if you are
using something on COM1 like a mouse, the IRQ which it shares with COM3
will make the operation of one or the other [mouse and/or modem]
non-existant!). Now you can plug you KPC up and use your favorite term
program to do packet. Since every modem is different, I would suggest
that you dig through the manual to find the correct jumpers or switches
for the modem.

Regards,

Organization: Biztech, Inc.

I'm trying to compile JNOS using TC++ 3.0, and (as I was warned in the
README) I was not able to link using the supplied config.h files, due to
dgroup space limitations.

So, I went into config.h and undef'd a bunch of things I don't really
need, including the bbs and netrom stuff.

Afterwards, I WAS able to link, but I had a few problems. Any assistance
would be greatly appreciated.

The problems are:

1) the executabe is huge (400+k)
2) it doesn't work (errors freeing unallocated memory, quickly followed by
freezing).

I don't have pklite. Is this a major problem, and if so, are there any
options? What exactly does pklite do?

Is there a trick to downsizing NOS other than modifying config.h??

Are there certain things which MUST be linked in?

Also, I am curious about the MULTITASK feature. Does this mean that when shelling to DOS, NOS continues to run?

I have defined MULTITASK and undefined XSPAWN.

Thanks,

There has been some discussion lately in a fossil interface for TNC's ... I have found something that might be of interest. The file itself can be requested by sending email to:

file-request@stat.com

first line of text should be:

get /waffle/files/ham/fe.zip

FE - ComPort Monitor Software
Version 1.1

Copyright 1987, 1988, 1989 W. B. Fair, Jr.
All Rights Reserved

FE, short for Front End, is a program that is used to monitor and access the serial port of an MS-DOS system. It uses FOSSIL functions for some degree of system independence in serial port access.

FE features configurable serial port access, job scheduling and time dependent configurations, built-in monitor and terminal modes, DOS exit Errorlevels for modular use in batch file programming, and support for both telephone modems and ham radio terminal node controllers.

FE has been tested under MS-DOS 3.1, 3.2, and 3.3, under DesqView <tm> and DoubleDOS <tm> multitaskers. It has been used with AEA's PK-232 <tm> and MFJ's MFJ-1274 <tm> TNC in on-the-air testing for many months with not problems. It is meant to be used with the companion PBBS software.

FE may be freely distributed in unmodified form. You may

change the archiving format to suit your tastes, but DO NOT screw with the executable code. If you find FE and the associated software to be of value, a contribution would be appreciated.

For additional information, ideas, thoughts, etc. contact W. B. Fair, Jr. (Skip KE5WJ). Gripes, complaints and flames can be sent elsewhere.

The ComPort BBS
FidoNet 1:390/1.0
300/1200/2400/9600 baud
Slidell, La.
(504) 643-6380

or

KE5WJ-2 PBBS
Slidell, La.
145.01 MHz Packet Radio

QUICK INSTALLATION

If you just cannot read the rest of this documentation, here is a quick guide to installing and using FE. Reading the documentation, however is recommended.

1) First create a subdirectory for use by FE and copy all files in the archive into it. This subdirectory can also be used for other related BBS files.

2) Install your FOSSIL driver and make sure it is working. You are on your own with that task, since installation procedures vary and improvements are continually being made to the FOSSIL software. The most common FOSSILs used at this writing are Ray Gwinn's X00 (a device drive which goes into your Config.Sys) and Bob Hartman's OpusComm (a TSR).

3) Edit the file FE.CFG to your liking. There should be ample comments in the distribution file. Basically, you will want to determine the serial port and baud rate, enter a title for screen display, and determine whether terminal or monitor modes are used on startup.

4) Make a batch file to run FE. You can run FE without a batch file, but that defeats it's purpose. A sample batch file called PKTBBS.BAT is included in the archive to get you going and show how it's done.

5) If you are using FE with a TNC, then make sure that the TNC serial interface to the computer is configured for the

correct baud rate as specified in the FE.CFG file. It must also be set to 8 data bits, 1 stop bit, and NO parity.

6) Execute your batch file (PKTBBS or whatever you use) and make sure that the software finds everything in order. If it isn't, reread the above steps or read the documentation.

CONFIGURATION FILE

By default FE uses a file called FE.CFG to determine its configuration information. If you want to use a different filename, the configuration file may be specified on the commandline. If you use FE.CFG, don't enter it on the commandline. See the commandline parameter section for more details.

The configuration file is a straight-forward ASCII text file and can be created and edited with any simple ASCII text editor. Be sure you save the file in ASCII, though. Control characters added by some word processors will cause trouble.

The format of the file is free format, for the most part. Any lines beginning with the characters @ # % * or ; are ignored and can be used as comment lines. Blank lines are also ignored and can be interspersed as desired for readability. Keywords are case insensitive; you can use upper, lower or mixed cases, as you prefer. Spaces between keywords and parameters are also ignored.

TITLE

Everything after the space following the keyword TITLE is used as a title for screen display on the top line. You put whatever you like here, if you leave it out a line identifying the software will be used. The line should be less than 80 characters to display properly.

PORT

The parameter following the keyword PORT is used to determine which serial port is to be used. At present the only acceptable values are 1 and 2, for COM1 and COM2, respectively. If you leave this out, the default value of COM1 is used. It can also be over-ridden by a commandline parameter.

BAUD

The parameter following the keyword BAUD determined the baud rate used for serial i/o. Valid numbers are 300, 1200, 2400, 4800, 9600, and 19200. If no valid value is used, 1200 baud is assumed. This can be over-ridden by a commandline parameter.

MONITOR
The MONITOR keyword is used to determine whether you want to monitor serial port data or not. When used with a TNC, setting MONITOR to ON lets you see what is happening on the channel. Valid parameters are ON and OFF; the default is ON.

TERMINAL
This keyword determines whether FE is initialized in TERMINAL mode or not. If set ON, FE will act like a dumb terminal program. For use with a PBBS, this is normally set OFF. Valid choices are ON and OFF; the default is OFF.

SOUND
NOSOUND
These keywords determine whether Ctrl-G (Bell) characters make a sound or not. If SOUND is used, whenever a Ctrl-G is monitored, a beep will sound. The default is NOSOUND, which ignores Ctrl-G's in monitored data.

EVENT
This keyword is used to specify the schedule used by FE. The following parameters specify the Days which the event is to be active, the start and stop time for the event, configuration to be used during the time period, and several DOS Errorlevels to be used on exit from FE during the time period. Valid Days are Mon, Tue, Wed, Thu, Fri, Sat, Sun, and All, however only All is guaranteed to work properly at present. Start and stop times are specified in 24 hour format. The first event should begin at 0000 and the last one should end at 2400. Overlapping times are not recommended.

The exit codes are specified in the form <X>=<N>, where <X> indicates the exit condition and <N> indicates the DOS Errorlevel to use on exiting. Note that DOS uses several errorlevels for its own purposes, so exit errorlevels less than 10 are not recommended. Valid exit conditions are I, which specifies an exit at the beginning of an event, B, which specifies an exit to load the BBS software, and M, which specifies an exit after recieving a mail transfer. It is up to your batch file to determine what actually happens when an exit occurs.

COMMANDLINE

When FE is executed, it is able to determine some of it's parameters from the DOS commandline. The general form of the commandline is:

FE [configfile] [-P1|2] [-Bn]

Note that all parameters are optional.

The first parameter allows a configuration file other thatn the default FE.CFG to be used. If you want to use the default FE.CFG, do not specify any configuration file on the commandline. The remaining parameters can appear in any order, but must begin with either a - or / character.

The P parameter allows you to over-ride the port specified in the configuration file. Valid parameters are -P1 or /P2 to select COM1, and -P2 or /P2 to select COM2.

The B parameter allows you to over-ride the baud rate specified in the configuration file. Valid values are 300, 1200, 2400, 4800 and 9600. For example to select 4800 baud, use -B4800 or /B4800.

I'm trying to get hold of the latest version of NET/Mac. On ucsd.edu there is a patcher program which will take version 2.3.19 to 2.3.20 but the latest version that appears to be available anywhere on the Internet (according to Archie) is 2.3.15. So does anyone have either version 2.3.19 or 2.3.20 that they could e-mail to me, or alternatively a pointer to an FTP site where I can get either of these versions ?

Thanks,

//Paul (G4BWQ)

Multiplexing COM ports is possible but very confusing.

You can share COM1 with COM3 and have both use IRQ4
You can share COM2 with COM4 and have both use IRQ3

It is best (from a confusion reduction standpoint) to have no holes
in using COM1-2-3-4, i.e., use COM1-2-3 not COM1-2-4. Your computer
will always assign the third COM as COM3 no matter what IRQ and address
you are using. So, while you think you are setting up COM4 the computer
thinks it is COM3. Confusing huh? I finally gave up that game and
switched the sharing to COM1.

You cannot share a mouse with anything else (that I have discovered).
So, if the mouse is on COM1, move the mouse to COM2, and move the

internal modem to COM1. Then you can share COM1 between the Modem and the TNC. You won't likely be using both at the same time.

Yes, this is a lot of hassle to get the stuff running. But, it is the only way I have been successful in making similar messes work.

You will need the manuals for the modem and the COM card to set the jumpers properly. I strongly recommend using MSD (Microsoft Diagnostics) to look at what you have the cards set at. This will help immensely in reducing the frustration. MSD is included with all windows 3.1 distributions (from Microsoft that is). Other good diagnostics are provided in QA-Plus. Try swapping the internal modem and what ever you currently have on COM1 (I have assumed it to be a mouse) first and get them working before you try to get the TNC working. Change as little as possible each time you try something. White down the answers the diagnostic tells you. However, REMEMBER the first COM is always COM1 and the second is always COM2, no matter how you have them configured by the jumpers.

Pull the modem out, leave it out for a while. Make the COM1 and COM2 swap that is noted above. This may only require you move the mouse to the connector on COM2 (all mouse programs I have used look on COM1 and COM2 for the mouse, automatically). Make sure that what what ever was moved to COM2 works fine. Then take the modem and switch it to use COM1 (my limited experience says internal modems can only be set to COM1 or COM2). (now you have the internal modem and COM1 using exactly the same address and IRQ [which is COM1]). Take the comm card, and using the manual, set its 1st comm port to COM3. Plug it in and run the diagnostics. The diags should show that you now have COM1-2-3, 1&3 sharing an IRQ but with different addresses. Now, if your communications program can handle a COM3, you should be able to get to your TNC through COM3. Use the power on message of the TNC to see if you have it right. Remember you will have to match the communications program speed with the speed of the TNC before characters will come out correct.

If you have never had the TNC working yet, pull the modem and make the TNC work on COM2 first. Otherwise, you won't know if you are fighting parameter settings or configuration jumpers. Write the parameters down when you get the TNC to work!

Did I say this was confusing? You bet I did, I only hope the tons of hours I have spent on trying to make this stuff work makes it easier for you.

Regards, Dave

Keywords: MFJ KAM Multimode

Greetings,

I am interested in hearing from anyone who has either an MFJ 1278
or a KAM/KAM Plus. These two units seem to be very similiar,
but the MFJ really appears to offer more for the money, but the
KAM seems like better quality... How about modems? The MFJ
looks like it can easily be upgraded to 2400 or 9600, but the
KAM is not, right? (or requires thier Data Engine?) Please
send email with your experiences (good and bad) and any
recommendations on these products, or any other comparable devices.

Thanks!

Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.

Due to the recent reorganization, it is also on a temporarily-
accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to add the groups created during the latest reorganization vote and the description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents

grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio

equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this

writing, the most recently added groups are also not available for reading by electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am planning on implementing my own software system for packet radio.
I have ordered the AX.25 spec from ARRL. Where Can I get the NET/ROM
(and/or KA-Node, TheNet or others) specifications? As a last resort
I guess I could take apart NOS, but I would rather work from specifications.

Thanks,

This has been asked I think, but there has been no deffinative
answer...

Where is the latest verion of NET/Mac?

ucsd.edu has 2.3.20 (well the updater.)

Someone posted that 2.3.*24* was available.
Where? Is it up for anonymous ftp anywhere?
If not can someone get it to ucsd.edu or another archive?

Please wait a minute to send Email to prug.or.jp.

We are changing the configuration of the network
from UUNET to IIJ (Internet Initiative Japan;The 1st
Japanese commercial Internet service).

Sending and receiving Emails to/from overseas are NOT
available now because of the matter of IIJ.
I bet we could communicate with overseas from this September.....?

Volumes 1 thru 8 are on the FTP site under 'minisport.laptop.hacker' but
where are volumes 9 thru 15? They are NOT there.

 Glenn,

|I'm not sure of IQ modulation in conjunction with the two parts you
|mention but I've had very good luck at building an IQ modulator for
|1200 MHz directly on PC board.

In RF 2802 or 2402, IQ input pins are connected to DBM simply via
differential amplifier for each.

I will appriciate it if you would describe your modulator.
And if the modulator is using rat-race-type mixer, 3dB hybrid mixer,
or something similar with phase splitter, especially about phase splitter.
(The both mixers are made of an microstrip square or circle on board
with two diodes.)

Easy to obtain 2Mbps QPSK demod chip, nobody I know has built high speed
QPSK modulator in Japan. To achieve it, I am studying digital radio
communication espc. modulators and demodulators in both theory and
actual imprement and SS as well.
Will you tell me some books suitable for it?

(Books published with the company that have the office in Japan,
such as McGraw-Hill or Prentice Hall, must be easy to buy.)

Thanks,

| I read with great interest your description of PRUG activities
| posted to r.r.a.packet. I was especially interested with the
| mention of a ic for QPSK at 2Mbps by Toshiba. Could you tell
| me what the part nubere is ? I have need of something like this
| at 2.11Mbps and 644Kbps.

Thank you for your interest in PRUG's.
The number is TB1202N/F. Suffix N means DIP and F means
surface mounting (flat) package. This works at a 5V supply.
And there is TA7782N, probably works similar to TB1202, requires two
voltages of supplying.

According to data sheet of TB1202, it takes externally two crystals,
for VCXO locking carrier and symbol rate, and some RCs as loop filters.
No more parts seems needed to output serialized data, and 192fs
or 384fs clock.

These chips are for satelite broadcasting reciever in SHF and
I am not sure of whether the same format is used world-wide.
NICAM (Near Instantaneous Compouned Audio Multiplex), also same QPSK

but slower speed, is used on earth in the UK and the Scandinavian.

|P.S. I tried you internet address, but no luck (bounced)

Sorry, that address cannot recieve from out of Japan, yet.
jf7wex@zao.gw.tohoku.ac.jp can. This article includes
reply-to line with this address.

MiniSport Laptop Hacker - Vol 13, 29 Apr 1993
Copyright(C) 1993 by Brian Mork.

>>> ADMIN
No, I'm not superstitious, but the number of this MLH edition did pass my mind. The last two weeks, my ZL-2 has been out of commission. Almost simultaneously, I received a letter from n7ftm (Bill) that his is having the same trouble. I've spent the last few nights tearing mine apart. Bad for me; good for you! I've got more specs on how the power supply works in the next edition of MLH.

In addition, I've been digesting volumes of documentation on Internet and Waffle, a BBS program meant to host users and process Internet E-mail and Usenet topical forums. I now have a node running on my own computer. See the new (and let's hope stable) address below.

Two people have sent me messages via USMail because something about the packet link wasn't getting messages through. Each edition, I try to confirm in the ADMIN section who all I've heard from. If I don't mention your callsign here, I didn't get your message. This round I've heard from N9ADS, N9LNQ, WA8WZX, W4NTG, W5SYT, N7FTM, KA9CAP.

>>> COM I/O ARCHITECTURE
Continuing from Volumes 7,8, and 10, there are only three more registers to cover.

Line Control Register (LCR) at address (BASE+3)

This register allows you to configure the format of the serial data leaving the UART and (simultaneously) the format expected by the UART. All bits of this register are read/write.

Bit 0&1: These two bits select how many data bits are transferred in each asynchronous character. 5,6,7, or 8 bits are selected with values of 00,01,10, or 11 respectively. For example, if you desire 7 data bits, set Bit0 to 0 and Bit1 to 1.

Bit 2: Set to 0 if you want one stop bit generated on outbound data and checked on inbound data. Setting to 1 chooses 1-1/2 stop bits with 5-bit data and two stop bits with 6,7, or 8-bit data.

Bit 3: Set to 1 to generate a parity bit. Set to 0 if you want no parity bit at all. If this is set to 0, the next bit has no effect.

Bit 4: Even Parity Select. When Bit3 is 1 and Bit4 is 0, an odd number of 1's is transmitted or checked in the data bits and parity bit. When Bit3 is a 1 and Bit4 is a 1, an even number of bits is transmitted or checked.

Bit 5: When set to 1, the function of Bit4 is reversed.

Bit 6: Set Break. When this bit is set to 1, the serial output is forced to the spacing state (same as data=0) and remains until changing this bit to a 0.

Bit 7: This is the Baud-Rate Divisor Latch Access Bit. This bit is set to 0 for normal operation allowing access of the transmitter and receiver buffers at BASE+0, and the Interrupt Enable Register at BASE+1. When set to 1, these same addresses access the Baud Rate Divisor.

Line Status Register (LSR) at address (BASE+5)

This register provides information about recent data transfer. All bits are not read/write.

Bit 0: Data Ready. The UART sets this bit to 1 whenever a complete incoming character is available in the receiver buffer. It is reset to 0 by writing a zero or by reading the receiver buffer. Bit1 through Bit4 are "errors" that produce a RLS interrupt (see IER and IIR descriptions).

Bit 1: Overrun. This bit is set to 1 whenever the receiver buffer was not read by the CPU before the next character was transferred into the

receiver buffer (overwriting the lost character). This bit is reset to 0 whenever the CPU reads the LSR.

Bit 2: Parity Error. If this bit is 1, the received character did not have the correct even or odd parity as selected by the bits in the LCR. It resets to 0 whenever the CPU reads the LSR.

Bit 3: Framing Error. This bit is set to 1 whenever the stop bit following the last data bit (or parity, if selected) is detected in the spacing level. (A stop bit is suppose to be mark status.)

Bit 4: Break Received. This is set to 1 whenever the received data input is held in spacing status longer than a full word's time: the total of start bit, data bits, parity, and stop bits.

Bit 5: Transmitter register empty. This bit is 1 when the UART is ready to accept a new character for transmission. It actually switches to 1 when the previous character is moved from the transmitter holding register to the transmit shift register. It becomes 0 concurrently with the loading of the holding register by the CPU.

Bit 6: Transmitter shift register empty. This bit is 1 whenever the shift register is idle (nothing being transmitted). It becomes 0 when the shift register gets a character from the transmitter holding register.

Bit 7: Permanently 0

Baud Rate Divisor Latch at addresses (BASE, BASE+1)

These two registers set the bits per second rate transmitted by the UART. This is a 16-bit divisor for the clock fed into pin 16 of the 8250 UART, giving a frequency *sixteen* times the desired baud rate. Pin 16 is usually fed with a frequency of 1.8432 MHz.

The LSB (least significant byte) is written to (or read from) address BASE, and the MSB (most significant byte) is written/read from address BASE+1. This is true only when the Divisor Access Bit in the LCR is set to 1.

The following table can be used if a 1.8432 Mhz clock is used (table values are decimal):

	300	1200	2400	4800	9600	19200
MSB	1	0	0	0	0	0
LSB	128	96	48	24	12	6

Lastly, a request: Please look in any data book you have and try to identify the following three chips. Two of each are surface mounted on the bottom side of the ZL power supply switching regulator board. I need to find out how they're suppose to work to know if mine are working! A pinout and short description would be GREATLY appreciated!

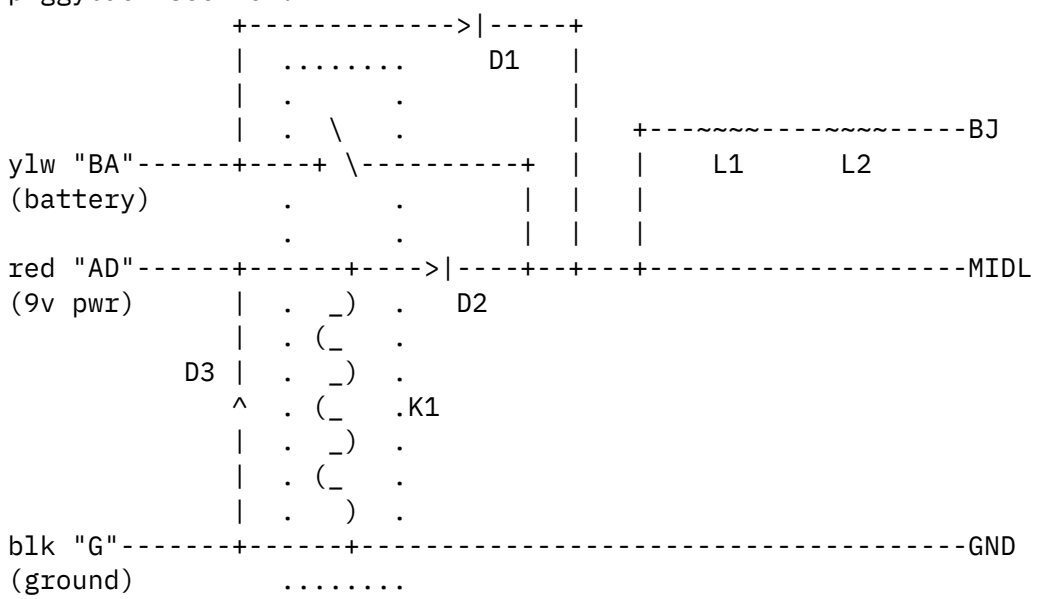
MiniSport Laptop Hacker - Vol 14   25 May 1993
Copyright (c) 1993 Brian Mork

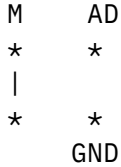
>>> ADMIN
Things have been pretty quiet this time around. I got only one message back from the field. In the meantime, I managed to bring up an Internet node in-house, and I'll start porting these newsletters over there, too. Look in the micro.zenith and rec.radio.amateur.packet forums. If you read these MiniSport Laptop Hacker newsletters, please make it a practice of kicking back at least a one line message indicating what parts are particularly useful or not useful.

>>> POWER SUPPLY HARDWARE
Well, for those of you that have been following the MLH series, you'll know that one of my power supplies has been giving trouble. It finally gave up the ghost. Simultaneously I heard from another ham who had nearly identical symptoms: The Power & NumLock LEDs flash on for about 1/2 second and then the computer power downs by itself. From Internet, I heard from one person who bought his for a real price, with a guarantee. Its power supply died this way, also, and the seller replaced it. He's had no problems since. Too many similar stories! I wanted to know what's going on! In the meantime, I'm looking to buy broken MiniSports.



I tore mine open and started from the exterior working in. There are a

handful of components that condition power and select where power is coming from --the AC adapter or the battery. This initial power supply section is documented below.



My two ZL-x computers are different:

Older	Newer
* Power supply piggyback card with number PA2020P25	* Power supply all on one card with number PA2020P65
* Motherboard 1PC1606AMB-40I with green patch wire from TP43	* Motherboard 1PC1606AMB-41I, no patchwire from/to Test Point 43.
* U47 BIOS is "BIOS V3.3D"	* U47 BIOS is "444-804"
* Disk controller WD37C65BJM has manufacture date in 22nd week of 1989.	* Disk controller is same part number dated 44nd week in 1989.

The power conditioning sections are physically different, but electrically they're the same. I expect my older one was a "fix-it" prototype that later made it onto the production board. Here's the schematic of the piggyback section:

D1,D2 - two B8300s or integral N9K-60QC04
D3 - ceramic bubble (part no. unknown)
L1 - approx 24 turns on 1/4" form
L2 - 1 turn on core
K1 - SPDT DIP relay, bottom view pinout:

BJ named because the older power supply has a Blue Jumper wire.

MIDL named because it is the MIDDLE wire connecting the piggyback board.

Operating from battery power, power comes in through D1 and out both the BJ and MIDL connections. When the 9v is available, current comes in through D2, again going out BJ and MIDL. My suspicion is that one of

these carries the main power current and one is a monitor tap, i.e., indicates when AC sourced power (9v) is available. Additionally, K1 pulls the contact closed, providing current back to the battery pack for charging. If you listen carefully when 9v is connected, you can hear K1 click closed. the glass diode (D2) provides a shorted path for the current spike coming from K1 when it clicks off.

Notice that this circuit is in operation whether or not the computer is turned "on." It might be more appropriate to think of the computer as always being on; when you press the on button, the power supply just "upgrades" to full output status. The rest of the power supply (all stuff between what I presented above and the header I described back in issue ????) lives on an approximately 5"x4" circuit board. Reverse engineering of this board has been slowed by my inability to identify three chips. There are two of each of the following: MB3778 (16-pin IC), K612 (3-terminal + heat sink tab), and D4049G (16-pin IC). PLEASE FORWARD ANY INFORMATION YOU HAVE ON THESE THREE CHIPS.

Ryuji Suzuki (jf7wex@jf7wex.sdj.miyagi.prug.or.jp) wrote:

: In RF 2802 or 2402, IQ input pins are connected to DBM simply via
: differential amplifier for each.

  I've had good luck using differential ECL logic (10116 variety) to drive DBMs directly. They have adequate current capability along with good balance and speed. I've used this to direct sequence modulate a variety of Schottkey diode mixers. I am interested if you have a good

and simple discrete transistor design though.

: I will appriciate it if you would describe your modulator.
: And if the modulator is using rat-race-type mixer, 3dB hybrid mixer,
: or something similar with phase splitter, especially about phase splitter.
: (The both mixers are made of an microstrip square or circle on board
: with two diodes.)

Yes, I use 6/4 lambda, rat race mixers which I've folded to reduce board space. The first mixer is driven by the PN generator for spreading and de-spreading. The other two mixers are driven by a Wilkinson power divider from the previous mixer on the signal port and by a 90 degree hybrid on the LO side. This phase splitter is also folded to reduce board area. For good amplitude accuracy the line widths/impedances need to be pretty well controlled. So far, I've built everything at home in the ham shack but still get phase accuracy within a degree or two. Amplitude accuracy hasn't been quite as good but is also not quite as sensitive since this is on the LO side and I am saturating the mixer diodes. The entire assembly is about 10 X 12 cm on standard epoxy/fiberglass board.

I'm using dual, packaged surface mount diodes and SMT resistors/capacitors for the termination of the hybrid and DC blocking. Parts cost is extremely low. I'm floating each mixer so that I can drive them differentially from a single supply. RF grounds for the termination and IFs are provided by radial transmission lines (fan lines).

So far, my main use for the I/Q modulation capability has been to generate a SSB pilot tone(above the data). The system I'm building phase locks on a pilot tone in order to be able to do coherent detection. To date, I've only modulated data on both mixers together rather than making use of the full I/Q capability. Because I'm choosing channel coding with no DC component, the spectrum near the carrier is free for other uses. It seems that a simple 90 degree audio hybrid would give a coherent SSB audio channel as well, almost for free. I haven't decided what to use it for yet though (:>)

My spreading sequence operates synchronously with the carrier/pilot and data clocks. Therefor, once I have acquired PN synchronization (by software rather than a hardware loop) and have locked onto the pilot tone, everything stays locked and synchronous and I also have all data clocks recovered.

I'm generating the carrier, at 1265 MHz, in one half of a dual PLL chip. The second half is used to phase lock the master VCXO (at 31.47 MHz) to the received pilot tone. The carrier oscillator uses a coaxial line resonator and results in very low phase noise. See my 1988 Ham Radio Magazine microwave series for a similar design.

Thus the system is direct conversion and fully synchronous and the RF portion is largely printed on PC board so it is also almost "no-tune". The spreading can be turned on or off as desired. I haven't finished

the low level stages of the RF chain but I'm trying to use standard MMICs and a simple diode attenuator arrangement which I can turn around for power/gain control between transmit and receive. The filtering is done by an interdigital filter (not printed but using the same sort of resonators as the 1265 VCO) which is in the middle of these low level stages. I'm only trying for .5-1 watt on the main board but have already built a 20W PA with T/R switch which can be added. My goal is to be able to build the low power portion cheaply enough that additional radios/hops can be added rather than the P/A.

The goal of the radio is 250 Kbps data to the user. See our paper in the 9th ARRL CNC for a description of the Hubmaster protocol which supports this. The addition of spread spectrum and fully synchronous and coherent radios will require some additions to this protocol but the fundamental operation is similar.

: Easy to obtain 2Mbps QPSK demod chip, nobody I know has built high speed
: QPSK modulator in Japan. To achieve it, I am studying digital radio
: communication espc. modulators and demodulators in both theory and
: actual imprement and SS as well.
: Will you tell me some books suitable for it?
: (Books published with the company that have the office in Japan,
: such as McGraw-Hill or Prentice Hall, must be easy to buy.)

I haven't focussed much on channel coding yet. I've tried BPSK but I agree that QPSK could be a good addition and inexpensive chips to perform this would be great. If you have literature, or can point me toward some, I'd like to take a look at these parts. Hopefully they are available outside of Japan.

I'm not sure that I can help suggest the best books. I'm still in need of learning a lot myself. You might look for some of the texts authored/edited by Kamilo Feher and published by Prentice Hall. Those should be available.

I expect that most of the narrower bandwidth channel coding schemes (for NADC,JDC,CDMA etc) are beginning to be done digitally and then applied to the I/Q modulator.

I believe that the GMSK modulator in the GRAPES 56 kbps modem works this way. Of course, this starts to be more of a problem for amateurs at higher data rates.

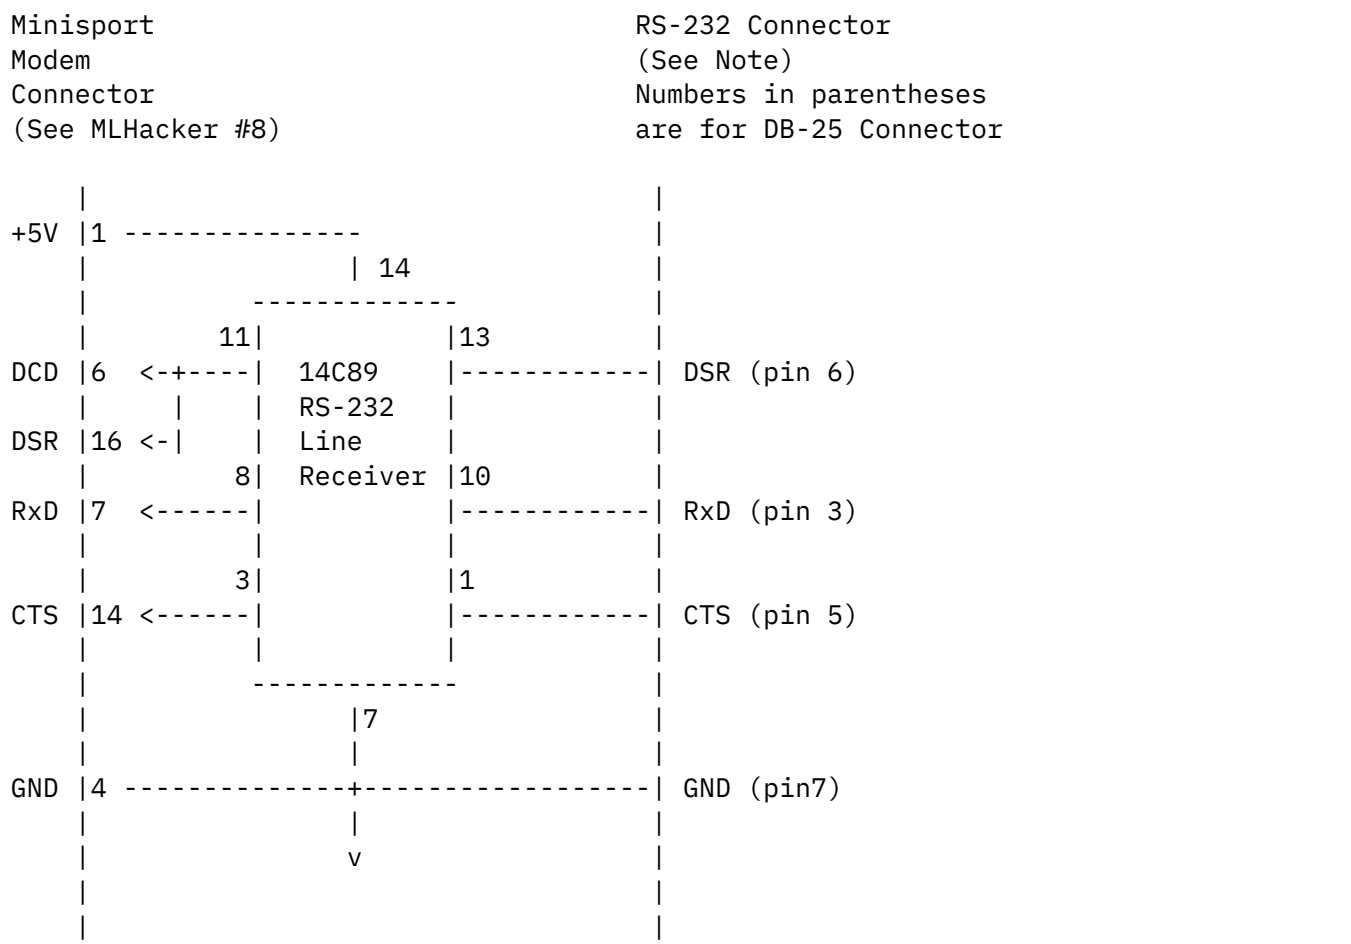
MiniSport Laptop Hacker - Vol 15 7 July 1993
Copyright (c) 1993 Brian Mork

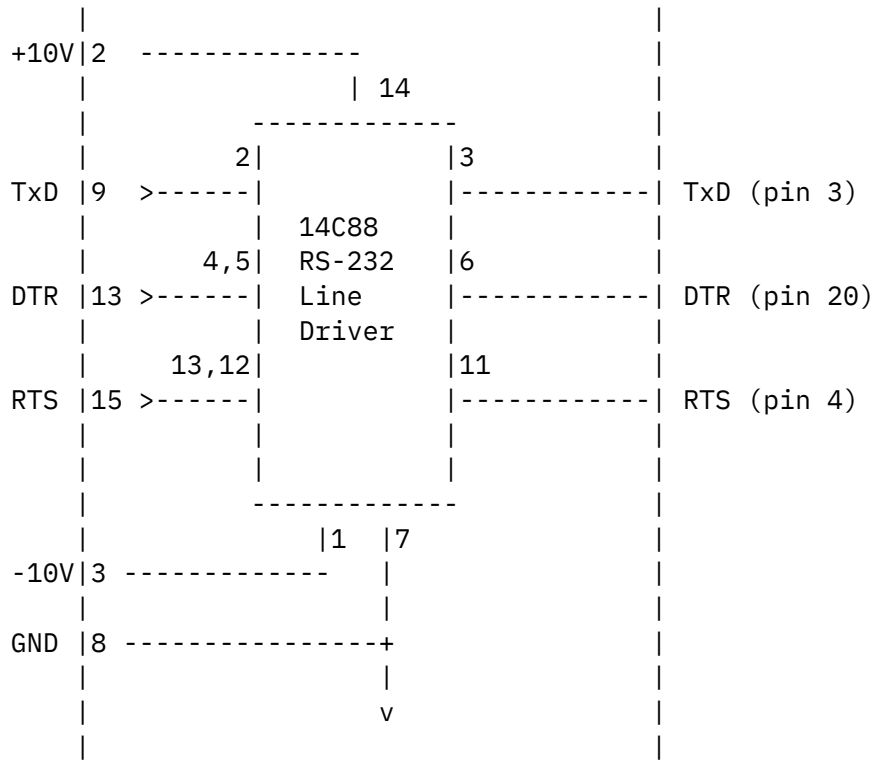
>>> ADMIN
This month has been busy! I've been installing (definitely progressive tense English --these things seem to never end :) an Internet node and that has taken a lot of time. Watch the comp.sys.zenith and rec.radio.amateur.packet newsgroups for future issues of MLH if you're on Internet. Exposure on that net created a flood of feedback. The biggest feedback item? MiniSports fail by loosing their power supply. I'm still working on the project from last issue --restoring my busted power supply.

This issue is sent out with R95 on those nets that require it. R95 is a neat program that automatically splits and reassembles large files. Let me know if it works for you before I terminate the "trial run" and commit to using it long term. If you'd like a copy and you're Internet capable, I'll send you a UUENCODEd copy. If you're Amateur Packet only, I can copy stuff onto disk if you make it a no-cost option for me. I'll put a variety of other MLHacker related goodies on there, too.

Flying for the Air Force is my primary job. They're sending me TDY to Saudi Arabia again, which will knock out all this fun stuff until mid-September. Look for Volume 16 at about that time.



>>> RESOURCES
I came across three articles you may be interested in. The first is "Real World Portability," in Oct 1989 REMark, written by Nathan Baker. It is a product review of the Minisport when it just came out on the market (you don't want to know the initial price!). In the same issue, William M. Adney writes "On the Leading Edge" which featured the Minisport as one step in ZDS's progression on the frontier of new system designs. The third article, "The Care and Feeding of MinisPorts," by Mary Ellen Shutz, appears in the July 1991 issue of REMark. It discusses power management, an expanded and more authoritative version of MLH Volume 11. After read-



ing the third article, I notice an error on my part. Using SLOW mode in the SETUP is not the same as invoking SLOW mode via the FN-F3 keyboard sequence. The SETUP option actually chooses between 8 MHz and 4.77 MHz operation, but the keyboard sequence just inserts wait states to slow the system down. REMark is the official Zenith Data Systems magazine.

>>> TECH HELP REQUESTED
I have the PMP (Poor Man's Packet) running in the modem slot of my Minisport, thanks to the help of a local ham (Ron, N7SXD). The receive works fine, but upon transmit, the software chokes. I'm convinced that on the Minisport, the algorithms coded in C just aren't fast enough. Has anybody out there rewritten critical sections in assembly?

>>> DOUBLE YOUR SERIAL PORT COUNT
This schematic came in via Internet. Thank you Peter (N9IYJ)! It connects into the internal modem header and converts it from a TTL port to a standard PC compatible serial port. Quoting Peter...

"Following is an attempt at an ASCII schematic for a second serial port for the Minisport. The electrical part is pretty simple (the 14C88 and 14C89 do all the work), the tricky part was the mechanical assembly. I built it on a small piece of perfboard, and carefully matched the 16 pin header so it slides right into the modem slot. Since the 8 pin jack was a lot bigger than the phone jack that is supposed to plug into the modem, I cut away part of the modem slot cover to provide access.

Note: I terminated the RS-232 in an 8-pin modular connector, using
a pinout to match an existing cable. Since the cable didn't have both
DCD and DSR, I tied them together at the minisport side. There is another
receiver available if you want to bring DCD out to pin 8 of the DB-25
connector."

[Article crossposted from rec.radio.amateur.digital.misc]
[Author was Glenn Elmore]
[Posted on Thu, 8 Jul 1993 18:58:34 GMT]

Does anyone know of a source for a small number, perhaps 6-10, of 10 MHz SIO (Z80 family) serial comm. chips to use in increasing the speed of a TNC2 or clone?

A quick look of the <standard places> doesn't reveal anything. PacComm sells a 10 MHz version of their Tiny2 but has it on 3 month delivery due to lack of the faster CPU and SIO parts.

I want to upgrade some TNCs for temporary use in a high speed backbone and need some parts.

Any pointers would be appreciated.

Thanks,

Glenn Elmore n6gn

I am interested in getting a tnc soon but still don't know what to look for after reading the faq. Specifically, what models are common, and how much they cost. I am also thinking of trying to hook up a Hewlett Packard 95LX

to the tnc (1 meg version). Has anyone done this? The HP95 is a palmtop computer running DOS 3.31. It has a serial port and I have successfully hooked it up to a modem. I have a Kenwood TH-28A HT. Is this radio acceptable for packet? I am looking for my callsign any day now (took the technician test on May 16).

I think you will find that British Gas use packet TNCs for some of their
telemetry stuff. They are slightly different to an amateur TNC in that the
modem is an FFSK one but apart from that, I would guess it is basically
the same. I use the same type of TNC here (and at a few remote node sites)
so they can't be *that* different.

Are you using the correct tone shift? I think some commercial RTTY uses
a 425Hz shift. You also need to check whether it is running 45 or 50baud

because that will screw your reception as well. Failing that, it might be
scrambled in some way...

Why bother? Apart from infringing the Copyright on KA-Node and Net/Rom,
you're gonna waste *alot* of time in coding something suitable. Blow a copy
of TheNet X1H (including tcp/ip auto routing) and leave the rest to the
programmers.

Last time I looked, you could get TheNet X1H from ftp.demon.co.uk. Not sure
of the directory, but I think it is in a 'hamradio' directory on there.

To put it simply, you have a problem. But, I believe you can probably also
fix this problem. :-) Read on....

>Well, I am going to assume for the sake of arguement that you are using
>COM1 for a mouse or something like that.

We'll keep this assumption---the fact that both serial ports (the actual
serial port and the one on the internal modem) are both set for com2 more
or less implies that something else is on com1 (or at least, uses IRQ3).

>Now being that you are using an
>internal modem, there should be some jumpers on it to switch the com
>port. What you will want to do is switch it to com 4 (because if you are
>using something on COM1 like a mouse, the IRQ which it shares with COM3
>will make the operation of one or the other [mouse and/or modem]
>non-existant!).

Sorry, but this is bad advice (for more details, see a recent, similar
thread on comp.dcom.modems, or e-mail me for the info). Basically, to put
it simply, no two devices may share the same interrupt. There are specific
cases where I/O cards are *DESIGNED* to get around this, but that's another
story (and different hardware).

In the ``normal'' configurations, COM1 and COM3 both share IRQ4, while COM2
and COM4 both share IRQ3. So, if you have a serial port on both COM1 and
COM2, you can't use IRQ4 and IRQ3 for anything else....meaning, assuming you
do have something on COM1, you can't use COM3, and if you have something on
COM2 (as you've said you do), you can't use COM4. This, of course, assumes
that you use the ``normal'' interrupt/address combinations for COM3 and/or
COM4.

Let's take a second look at what you have, and what you have to work with.
Since most (common) serial ports deal only with the lower IRQ lines (usually
only 3, 4, and 6), we'll only look at IRQ 2--7. Here's what the normal
assignments are:

   IRQ2: *reserved* (AT and above --- free on XT)
   IRQ3: COM2 *or* COM4

```
   IRQ4:  COM1 *or* COM3
   IRQ5:  LPT1
   IRQ6:  floppy drive
   IRQ7:  LPT2 (if it exists)

You might take a look at what devices you have, and what interrupts are
available/required by each.  You can probably re-arrange things to make
your system happy (e.g., one thing that you can usually do without problems
is to disable the interrupts on your printer port and then use that
interrupt line for something else).

E-mail me with the details of your system configuration, and we'll take
it from there.

OH2MKQ/TPK 1.81 Msg #:186  Date:04-07-93  Time:0:49Z

Hello,

I've purchased few ehternet (?) CONNECT ARCnet 2.5 Mbit/s cards for PC.

Now  I need a driver or a way to connect 2 or 3 NOS'es together with 'em. A
```

BOOT ROM that is missing would help too, I think.

If you don't know, PSE tell me who knows or an area in internet (there is too many to look for).

If you're still reading and know e-mail ADR for..:

CONNECT ARC-card (?)

I could tell you where to get them in the UK, but that probably isn't
much use to you :-)

Dave

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: --

If you do not know how to use HAM-server, send email to
HAM-server@GRAFex.Cupertino.CA.US. In the text, place HELP.

If you order a file and do not get it, check the index to be sure you have
spelled the filename correctly. If you have ordered the file correctly,
then order a new INDEX, as I may have moved the file to a different
directory. The system is still expanding, and I am trying to keep it in

managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated weekly and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

: Sorry, but this is bad advicee

Again, we will make the assumption that this person is using a mouse on
COM1: and the modem is currently on COM2: . Since this person will not
be using the modem simultaneously with the TNC (This is an assumption on
my part since this person could be planning on running a voice-line BBS
with a TNC gateway... But I doubt it.), it would be safe for bim to have
this seeming IRQ conflict. Again they will not be competing for the
interupt, since neither will be used in conjunction with the other.

Someone has set up a mail loop. I'll try to see what I can
do about it.

Why can't incompetent system administrators get a job sanitizing
telephones or something more suited to their skill level?

Amateur RTTY uses 170Hz shift, commercial uses 850 mostly. There are other odd
shifts in use as well...

The file I uploaded to UCSD.EDU should have been an exact copy of the
file on your system a few weeks ago John (G1YYH). I had not tried to
run the version of LHA that was included in the archive untill after
reading your post. All I could get it to do was guru, probably just my
old A1000 and 1.3 being picky.

I removed LHA from the archive and re-uploaded it to UCSD.EDU anyway.
So the copy that is there now should be OK. Let me know if you find any
other problems.

I should have mentioned in my first post that you will find AmiPac63.lha
in hamradio/packet/tcpip/incoming at least until Brian puts it someplace
else.

Jeff, just about any rig will work for HF packet. No, full duty cycle is
NOT needed for HF packet. It is a good idea under RTTY situations, but you
will find that the transmit time on HF packet is not very long. All pakcet
on HF is SSB compatible. Really its FSK "faked" by having the TU produce the
tones equivalent to the shift. Basically any TU wired to the mic jack on a
radio in LSB mode, will work. This is AFSK "audio frequency shifted keying".
Some 1200b packet might be found in FM in the lower portion of 10 meters.
As for the Icom, I cant comment, but our PacketCluster here has used a 747
for the past 2 years, continously, never turned off (cept in T-storms!) on
a HF packet port, and it has worked great!

Good luck!

Charlie

Daniel, they both work on TCP/IP because they both have KISS mode. Although
unless MFJ has upgraded the 1270's firmware, the old version would jump outta
kiss if left unattended too long. Use TAPR's version.
Just use a prog like nos, and it'll comm with the tnc fine.

The 1270 will do 9600 with either a G3RUH or a K9NG modem added to the modem
disconnect header. The KPC3 wont. Both are priced about the same.
Both come at 1200b out of the package.

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: --

If you do not know how to use HAM-server, send email to
HAM-server@GRAFex.Cupertino.CA.US. In the text, place HELP.

If you order a file and do not get it, check the index to be sure you have
spelled the filename correctly. If you have ordered the file correctly,
then order a new INDEX, as I may have moved the file to a different
directory. The system is still expanding, and I am trying to keep it in
managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it
might be because your return path is incorrect. My bounce mailbox fills up
quite regularly with bounce messages. And, since the path is incorrect, I
cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are
ignored.

A new INDEX is automatically generated weekly and when files are moved or
added.

/hamradio/newfiles/ contains files that have not yet been categorized. You
can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should
run across one of these, please let me know with email to
KA6ETB@GRAFex.Cupertino.CA.US

The question of the day is what is the best public domain and/or
shareware program that will do KPC-3? Eventually, I am going to make
the move to TCP/IP, but until then I would like a good program to start
my packet adventures...
A

Has anyone got a Baycom type Modem working on any of the Amiga Computers?
Could someone mail me the driver? (I normally use NOS, but a terminal type
program would be OK too.)

>Would someone tell me what QEX is? I don't think I have ever heard of it.

Since you ask... I'll give you my (admittedly biased) spiel (short
version)...

QEX is a small monthly magazine published by the American Radio Relay League. (The full name of the publication is "QEX: The ARRL Experimenter's Exchange"; "QEX" is sort of a pun on "QST.") It is intended for the amateur who is interested only (or primarily) in the technical/experimental side of ham radio, and is also intended to promote the development of new amateur technology. Subscription to QEX is separate from membership in the ARRL, although the cost is lower to ARRL members.

The magazine has been running at a size of about 24 pages (we generally have only about 4 pages of ads), although we expect to go to a standard 32-page count in the near future.

Here's the table of contents from the past two issues:

June 1993
   Features:
      "Variations on A Single-Tuned Circuit," by Wes Hayward, W7ZOI
      "Joint Designs for Yagi Booms," by David Leeson, W6QHS
      "Measuring SINAD Using DSP," by Jon Bloom, KE3Z
   Columns:
      "Digital Communications," conducted by Harold Price, NK6K, covering:
         KA9Q's convolutional FEC experiments
         Microsoft Windows
         Computer control of radios
      "Correspondence"

July 1993
   Features:
      "The Growing Family of Federal Standards for HF Radio Automatic
         Link Establishment (ALE)," by Robert Adair, KA0CKS, et al.
      "Turn Your PC into an Oscilloscope," by Dave Lichtenstein, AA6FJ,
         and Dave Nemec, NS6Z
      "DTMF Deluxe," by Hartmut Pasler, DL1YDD (reprinted from cq-dl)
   Columns:
      "RF," by Zack Lau, KH6CP (design/construction details of a no-tune,
         222-MHz transverter.

If you are interested in subscribing, contact djahnke@arrl.org for rate information.

I'm looking for members of the Mercury Amateur Radio Association (MARA) who are here on the net. I recently sent out a packet radio bulletin asking for members to respond and received quite a few replies. I'm interested in establishing a national MARA packet/Internet network for rapid dissemination of information.

Is there a MARA packet e-mail list? If not, I would like to establish one. No where on the MARA membership application is there a place for ones packet e-mail address. Looking forward to hearing from you. Perhaps someone from Headquarters is here on the net. 73s.

Hello!

I need to connect a DTE to a telemetry Bosch KF454 radio operating at
460MHz through some kind of modem. The DTE-DCE speed should be as high
as possible from 9600 to 19200bps. The radio interfaces with the modem
through a 4-wire connection. Also, the radio has the possibility of
being controled by the modem in things like RF power, squelch, etc,
through PTT.

The big question is: what modems are in the market that fullfil these
requirements (or close...)? Can you give, please, the fax number of some
companies taht sell them?

Thank you!

Regards,
Carlos Antunes.

Good morning. It's Sunday the 4th of July and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

And we start by saying a special "good morning" to all those listening from VHF National Field day sites.

Our main story involves a repeater abuser who is this week nearly ten thousand pounds poorer. On Friday the 25th of June, at Worcester Crown Court, Robert George Hitchcock, G1MTT, was successfully prosecuted for offences connected with the transmitting of music, abuse and obscenties on a number of repeaters, particularly in the West Midlands. It was the activities of Hitchcock and others which resulted in GB3BM being time and sensitivity limited over the last few months. At the end of the week-long trial, Hitchcock was fined three-thousand-five-hundred pounds, and was ordered to pay six-thousand pounds costs. The case, which was brought by the Radio Investigation Service of the Radiocommunications Agency, stemmed from considerable work by the RSGB's Amateur Radio Observation Service working in conjunction with local repeater groups. Close cooperation between radio amateurs and the RIS over a long period has resulted in this conviction which, it is hoped, will clean up several repeaters. It is expected that the substantial fine and costs imposed on Hitchcock will act as deterrent to would-be abusers of their amateur radio licences.

The expedition by the Bridgend and District Amateur Radio Club to Tusker Rock scheduled for late June had to be postponed due to fog. If weather conditions allow this time, the station will be operating from approx 2pm today using the callsign GB2TR. Activity will be limited to 2, 20 and 40 metres SSB only and for a maximum of four hours. The RNLI, Coastguard and Sea Cadets will all be standing by to evacuate the island if weather conditions deteriorate during the expedition. Tusker Rock is situated in the Bristol Channel, some five kilometres south east of Porthcawl. This WAB square (SS87) has never before been activated. For the IOTA award it is EU-124.

Next Thursday evening, the 8th of July, the callsign GB2BS will be aired by Brookfield School, near Portsmouth. The operators will be licensed students and school staff together with members of the Fareham Radio Club. HF operation will on 40 and 80 metres SSB only, and on 2 metres and 70 centimetres FM from 6pm to 10pm. This is a sponsored event and all monies raised will be donated to the Colour Scanner appeal for Kidney research.

The Emley Moor 1.3GHz Beacon GB3MLE has been off air for repairs. The Beacon which operates on 1296.930MHz is expected to be fully operational again by now. Reports would be welcomed by the keeper G3TSA.

Now a reminder that the deadline for nominations for the 1993 Young Amateur of the Year Award is the 31st of July. Full details of this prestigious award, and the associated prizes, can be found in the April RadCom, or can be

obtained from the Project YEAR Coordinator c/o RSGB HQ.

The RSGB Woburn Rally will take place on Sunday the 18th of July at Woburn Park, near the famous Abbey in Bedfordshire. See July Radcom page 41 for full details and a map of the surrounding area. For further information contact Norman Miller, G3MVV on 0277 225563.

Later this month is the AMSAT-UK Colloquium which takes place at the University of Surrey on the 29th of July to the 2nd of August. For reasons of University security, this is an all-ticket event. Anyone wishing to attend this fascinating event should contact AMSAT-UK without delay, and certainly before the 15th of July, on 081 989 6741.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From St Pierre & Miquelon, a large group of operators from the USA will sign own-call/FP0 from Friday the 9th until Tuesday the 13th of July on all bands 10 to 160 metres using CW, SSB and RTTY. ~From Iceland, LA6HL will be active as LA6HL/TF from Friday the 9th until Thursday the 29th of July. From the British Virgin Islands, K8CFU will sign VP2V/K8CFU from Thursday the 8th until Thursday the 22nd of July, mainly on 20m. From Greenland, N7PQO will sign OX/N7PQO from now until the 1st of August, whilst doing scientific research. From Grenada, CT3FN will be active as J3/CT3FN from today Sunday the 4th until Sunday the 18th of July on all bands.

We know of three rallies taking place today, Sunday the 4th of July:

The Kings Lynn Amateur Radio Club Rally is being held today at the Cattle Market, Kings Lynn. No other details are to hand.

The Newport Amateur Radio Society Junk and Boot Sale is being held at the Brynglas CEC, Brynglas Road, Newport, Gwent. Doors open at 10.30am, or at 10.00am for disabled visitors. Talk-in will be on channel S22.

The York Radio Rally is being held at the Tattershall Building, York Racecourse. Doors open at 10.30am, or 10.00 for disabled visitors. There are amateur radio, electronic and computer trade stands plus a bring & buy stall. Morse tests will be available on demand but only between 12.00 noon and 3.00pm and remember to bring two passport-size photographs. The car parking space is described as "ample". Talk in will be on channel S22.

We know of three rallies for next weekend:

On Saturday the 10th of July, the Cornish Rally is to be held at the Penair School, Truro. Doors open at 11.00am, 10.30 for disabled visitors. There are the usual trade stands. Ample parking space and refreshments are available. Further details from Barrie, G0NNR on 0872 862046.

And on Sunday the 11th of July, the Horncastle Amateur Radio Electronic and Computing Fair is to be held at the Queen Elizabeth Grammar School Sports Hall, Horncastle, Lincs. The event features clubs stands and a bring & buy stall. Catering facilities are available on site run by the Horncastle Youth Club staff and members. Talk-in will be on channel S22. Further details from

G6CZV on 0507 522482.

Also on Sunday, the Sussex Amateur Radio and Computer Fair is to be held at Brighton Racecourse. Doors open at 10.30am There will be trade stands and a bring and buy stall. Refreshments will be available and there is also a picnic area close by. Further information from Ron, G8VEH, on 0903 763978 evenings or 0273 415654 during office hours.

HF contest news now:

The Venezuela SSB Contest is taking place this weekend finishing at 2400 today. See June RadCom page 16 for further information. The RSGB SWL Contest will take place from 1200GMT on Saturday the 10th to 1200GMT on Sunday the 11th of July for CW or SSB on 160 to 10 metres, excluding the WARC bands. See July RadCom page 21 for the rules.

Now some VHF contest news:

The largest VHF contest of the calendar takes place this weekend. The RSGB VHF National Field Day Contest started at 1400GMT yesterday, Saturday the 3rd and ends at 1400GMT today. Activity is on the 70, 144, 432 and 1296MHz bands. See March RadCom page 82 for the detailed rules. The next scheduled RSGB Contests are the 144MHz Low Power on Saturday the 24th and the 432MHz Low Power on Sunday the 25th of July. See February RadCom on page 66 for details.

And now the solar factual data

With the more active side of the sun coming into view, the period from the 21st to the 27th of June saw a considerable increase in solar activity, with spot counts back to more like what we would expect. There has been a number of M type flares and a considerable number of Sudden Ionospheric Disturbances, mostly lasting only a short time. Spot counts increased every day and meaned about 63, though by the 27th the count reached 80. The solar flux also increased from 91 units on the 21st, up to 128 units by the 27th, giving an average of 112 units for the period. The geomagnetic activity was affected by at least seven M-type flares, the largest being an M9.7/2B on the 24th causing a magnetic storm at high latitudes. However it did not last long and activity had declined to quiet levels by the 27th. The period averaged an Ap index of 11.8 units. The state has been 'mag storm warning' at first then 'nil' from the 25th. The radio quality indices were very good up to the 24th but with the large M9.7 flare they collapsed to very poor. A recovery was under way by the 27th with levels being back to normal. The aa indices, as supplied by the British Geological Survey for the period 15th June to the 21st June, were at quiet levels, with the daily averages being only 8.3 nanoTeslas, about K1. There was no disturbed period but many quiet ones down to only 2 nanoTeslas; this is the quietest period so far since June 1991 when this data was first broadcast. The X-Ray flux increased very considerably, reaching B6.4 on the 24th and remaining high. It was still B4.7 on the 27th. The period averaged B3.7 units.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon,

averaged 7.9MHz, with the 22nd being up to 8.7MHz but dropping to only 6.5MHz with the mag storm on the 24th. However levels quickly recovered and were back to 8.2MHz by the 27th. The darkness hour lows have not varied much and averaged 4.7MHz. Maximum frequencies are around 21.00 hours and the lows 04.00 hours UTC.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have been affected by the high latitude magnetic storm and averaged 6.9MHz. The darkness hour lows averaged 5.2MHz.

The sun spot count for cycle 22 is declining much faster than the predictions and are leading these by at least 6 months. A recent review of past cycles gives a mean rise of 3.8 years to the maximum and a fall of 6.9 years to the minimum. Cycle 22 beat these means on the way up taking only 2.75 years to reach the maximum - it looks as though it will beat the decline time as well.

And lastly the solar forecast:

This week, the active side of the sun will be rotating away, solar flux levels are expected to be about the 95s. Geomagnetic activity is expected to be quiet to just unsettled. The radio quality indices are expected to be at normal levels.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T V and G7 O X series, and Novice calls in the 2 0 A F and 2 1 B Y series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Hi,

We've been messing around withNOS 1.08DF. Its rather new so we don't know all the "ins-and-outs" yet.

We currently have it running on a 486 with an Ethernet connection. Also attached to the 486 are two radio ports.

What we would like to do is allow incoming telnet connections on the ethernet from *ANY* IP address. That's easy enough. The hard part is that we would like to reject the JNOS BBS users from starting an outbound telnet connection to anything other than a 44.x.y.z (so they cannot connect to Internet hosts - only AMPRNet hosts).

Anyone know how to set that up?

Also, the delete key is a pain the rear end! People who telnet into the JNOS BBS and hit the delete key see a ^H (the delete actually does work, its just annoying to see the ^H).

Thanks for any help and 73s,

- Gerry

References: <1993Jun29.155154.326@lynx.dac.northeastern.edu>

 Most of the currently working packet/internet gateways which allow telnet and remote conferencing from different ports simultaneously are located in the following ftp site and could be downloaded anonymously:

FTP-site : ftp.cs.buffalo.edu
Dir : /pub/ham-radio
FileName : packet_gateways

Well but be prepared,as getting permission to use the conferencing port from an internet account requires a dedicated account to the packeteer, and anonymous accounts are not granted that priviledge,which means that one must get the permission of a gateway maintainer to get a dedicated account on the gateway:I have bad experience with that as my packet and internet emails addressed to gateways sysops have been integraly discarded and not replied...i am not discouraging but just stating things as they are...

So,wish for all very goos luck in a nice packet DXing and TCP/IPing.

Hi All,

I am looking for a FTP site for the latest JNOS software.. I think they are running 1.10 version now. I have left several message to the author but did not get a reply.. I dont have access to Archie, so, any help in finding the last version would be appreciate..

Try wg7j.ece.orst.edu in the beta directory. They are up to version
110x5 now. The x? indicates that a) it is experimental and b) the
current version.

I would be very surprised if you leave a valid mail address you don't get a
reply.

The gateway operators have no reason not to reply to reasonably made
requests.

I have a KPC-3 that I am attempting to connect to my system. I have an
internal modem that uses com2 and an external port on com2 that I have
connected to the KPC-3.

Am I allowed to use the external port even if there's an internal board
that uses it (but obviously not at the same time)? My TNC program
(KaGold) won't recognize the connection and says there's a communications
problem.

What's the solution? I hope if doesn't mean I have to install a board to
get another serial port.

Thanks for your help.

Well, I am going to assume for the sake of arguement that you are using
COM1 for a mouse or something like that. Now being that you are using an
internal modem, there should be some jumpers on it to switch the com
port. What you will want to do is switch it to com 4 (because if you are
using something on COM1 like a mouse, the IRQ which it shares with COM3
will make the operation of one or the other [mouse and/or modem]
non-existant!). Now you can plug you KPC up and use your favorite term

program to do packet. Since every modem is different, I would suggest
that you dig through the manual to find the correct jumpers or switches
for the modem.

Regards,

Please allow me to write about our plans to experiment high speed digital
communication over radio in Japan.

TNC
  We have a type of TNC named "TNC-Z", developed by Masaaki YONEZAWA
  (JE1WAZ), using HD64180S(HITACHI), dedicated to kiss-mode.
  It can handle up to 2Mbps differntial Manchester symbol (and NRZ/NRZI)
  at radio port. Because it aims to be used for multi mode of radio,
  only a outer MODEM is available.
  PCB and diagram of TNC-Z have already distributed. Size of PCB is
  4 x 3+3/8 (in inch).

FSK

We have already experimented 64Kbps at 1200MHz for several times.
At that time, a pair of IC-1200 is used for full-duplex.
(It is hard to work for the RIG as both TX and RX concurrently.)
The modulation was done directly at the VCO of the TX-RIG,
(Because of PLL and not scrambled, we concluded to use that symbol.)
and a small external circuit, using MC-3356P(MOTOROLA), which converts
IF of IC-1200 (136MHz) below into 10.7MHz, filter it, and shape
detected signal, for demodulation was prepared.
The book "High-speed Packet TNC" which describes V.27ter, V.29,
64Kbps FSK, and already distributed PCB at that time for them
has published with genny.or.jp, but sorry for only Japanaese edition
is available.

RF part was further improved to be independent component
separately from up-converter. The circuit and PCB, MC-2833P
(MOTOROLA) as TX-part, the same 3356P added local osc
(crystal controlled) and RF amp in as RX,
also including PTT(RTS) control and voltage regulator,
had developed by me.
This RF PCB will be orderd soon. Size of this PCB is
4+3/4 x 3 (in inch).

No filter was used at that experiments because digital filter was not
in time. Now, some prototypes have already built and evaluated.
All digital filters had developed by Shin'ichi KANNO, JN1JDZ.
He is selecting from among them and turning it to practical use.
Odering its PCB is in progress.

PSK (being planned out.)

Some kinds of suitable chip, dedicated to demodulate QPSK,
are supplyed for consumer products. A kind is for NICAM, about 750Kbps.
(728Kbps or 768Kbps??) Another is for also PCM audio channels of satelite
broadcasting, 2.048Mbps.
I found chips supplyed from TOSHIBA for each use, and from MICRONAS
(Finnish company) for NICAM.

Problem still lies in modulating. I know some groups using
looking-up EPROM and D/A, and existence of variously applicable chips,
useful for this purpose, from RF MICRO DEVICES.

I think demodulator must be composed cheap and simply, but modulator
is up to how construct. In case of using the RF-2802 or 2402,
containing 90 degrees hybrid phase splitter and two balanced mixers,
it is easy to do so. And the catalog says "Low Cost".
I am interested in using them. Anyone used? How much did it cost?

Protocol and software

We simultaniously reserch broadcasting-type protocol for scattering
USENET compatible news, amprnet-JA, over radio.

Multiplexing COM ports is possible but very confusing.

You can share COM1 with COM3 and have both use IRQ4
You can share COM2 with COM4 and have both use IRQ3

It is best (from a confusion reduction standpoint) to have no holes
in using COM1-2-3-4, i.e., use COM1-2-3 not COM1-2-4. Your computer
will always assign the third COM as COM3 no matter what IRQ and address
you are using. So, while you think you are setting up COM4 the computer
thinks it is COM3. Confusing huh? I finally gave up that game and
switched the sharing to COM1.

You cannot share a mouse with anything else (that I have discovered).
So, if the mouse is on COM1, move the mouse to COM2, and move the
internal modem to COM1. Then you can share COM1 between the Modem and
the TNC. You won't likely be using both at the same time.

Yes, this is a lot of hassle to get the stuff running. But, it is
the only way I have been successful in making similar messes work.

You will need the manuals for the modem and the COM card to set the
jumpers properly. I strongly recommend using MSD (Microsoft Diagnostics)
to look at what you have the cards set at. This will help immensely
in reducing the frustration. MSD is included with all windows 3.1
distributions (from Microsoft that is). Other good diagnostics are
provided in QA-Plus. Try swapping the internal modem and what ever
you currently have on COM1 (I have assumed it to be a mouse) first and
get them working before you try to get the TNC working. Change as little
as possible each time you try something. White down the answers the
diagnostic tells you. However, REMEMBER the first COM is always COM1
and the second is always COM2, no matter how you have them configured by
the jumpers.

Pull the modem out, leave it out for a while. Make the COM1 and COM2
swap that is noted above. This may only require you move the mouse to
the connector on COM2 (all mouse programs I have used look on COM1 and
COM2 for the mouse, automatically). Make sure that what what ever was
moved to COM2 works fine. Then take the modem and switch it to use COM1
(my limited experience says internal modems can only be set to COM1 or
COM2). (now you have the internal modem and COM1 using exactly the same
address and IRQ [which is COM1]). Take the comm card, and using the manual,
set its 1st comm port to COM3. Plug it in and run the diagnostics.
The diags should show that you now have COM1-2-3, 1&3 sharing an IRQ

but with different addresses. Now, if your communications program
can handle a COM3, you should be able to get to your TNC through COM3.
Use the power on message of the TNC to see if you have it right.
Remember you will have to match the communications program speed with the
speed of the TNC before characters will come out correct.

If you have never had the TNC working yet, pull the modem and make the
TNC work on COM2 first. Otherwise, you won't know if you are fighting
parameter settings or configuration jumpers. Write the parameters down
when you get the TNC to work!

Did I say this was confusing? You bet I did, I only hope the tons
of hours I have spent on trying to make this stuff work makes it easier
for you.

Regards, Dave

I'm trying to compile JNOS using TC++ 3.0, and (as I was warned in the
README) I was not able to link using the supplied config.h files, due to
dgroup space limitations.

So, I went into config.h and undef'd a bunch of things I don't really
need, including the bbs and netrom stuff.

Afterwards, I WAS able to link, but I had a few problems. Any assistance
would be greatly appreciated.

The problems are:

1) the executabe is huge (400+k)

2) it doesn't work (errors freeing unallocated memory, quickly followed by freezing).

I don't have pklite. Is this a major problem, and if so, are there any options? What exactly does pklite do?

Is there a trick to downsizing NOS other than modifying config.h??

Are there certain things which MUST be linked in?

Also, I am curious about the MULTITASK feature. Does this mean that when shelling to DOS, NOS continues to run?

I have defined MULTITASK and undefined XSPAWN.

Thanks,
Ben Mehlman KB2ERP

There has been some discussion lately in a fossil interface for TNC's ... I have found something that might be of interest. The file itself can be requested by sending email to:

file-request@stat.com

first line of text should be:

get /waffle/files/ham/fe.zip

FE - ComPort Monitor Software
Version 1.1

Copyright 1987, 1988, 1989 W. B. Fair, Jr.
All Rights Reserved

FE, short for Front End, is a program that is used to monitor and access the serial port of an MS-DOS system. It uses FOSSIL functions for some degree of system independence in serial port access.

FE features configurable serial port access, job scheduling and time dependent configurations, built-in monitor and terminal modes, DOS exit Errorlevels for modular use in batch file programming, and support for both telephone modems and ham radio terminal node controllers.

FE has been tested under MS-DOS 3.1, 3.2, and 3.3, under DesqView <tm> and DoubleDOS <tm> multitaskers. It has been used with AEA's PK-232 <tm> and MFJ's MFJ-1274 <tm> TNC in on-the-air testing for many months with not problems. It is meant to be used with the companion PBBS software.

FE may be freely distributed in unmodified form. You may change the archiving format to suit your tastes, but DO NOT screw with the executable code. If you find FE and the associated software to be of value, a contribution would be appreciated.

For additional information, ideas, thoughts, etc. contact W. B. Fair, Jr. (Skip KE5WJ). Gripes, complaints and flames can be sent elsewhere.

The ComPort BBS
FidoNet 1:390/1.0
300/1200/2400/9600 baud
Slidell, La.
(504) 643-6380

or

KE5WJ-2 PBBS
Slidell, La.
145.01 MHz Packet Radio

QUICK INSTALLATION

If you just cannot read the rest of this documentation, here is a quick guide to installing and using FE. Reading the documentation, however is recommended.

1) First create a subdirectory for use by FE and copy all files in the archive into it. This subdirectory can also be

used for other related BBS files.

2) Install your FOSSIL driver and make sure it is working. You are on your own with that task, since installation procedures vary and improvements are continually being made to the FOSSIL software. The most common FOSSILs used at this writing are Ray Gwinn's X00 (a device drive which goes into your Config.Sys) and Bob Hartman's OpusComm (a TSR).

3) Edit the file FE.CFG to your liking. There should be ample comments in the distribution file. Basically, you will want to determine the serial port and baud rate, enter a title for screen display, and determine whether terminal or monitor modes are used on startup.

4) Make a batch file to run FE. You can run FE without a batch file, but that defeats it's purpose. A sample batch file called PKTBBS.BAT is included in the archive to get you going and show how it's done.

5) If you are using FE with a TNC, then make sure that the TNC serial interface to the computer is configured for the correct baud rate as specified in the FE.CFG file. It must also be set to 8 data bits, 1 stop bit, and NO parity.

6) Execute your batch file (PKTBBS or whatever you use) and make sure that the software finds everything in order. If it isn't, reread the above steps or read the documentation.

CONFIGURATION FILE

By default FE uses a file called FE.CFG to determine its configuration information. If you want to use a different filename, the configuration file may be specified on the commandline. If you use FE.CFG, don't enter it on the commandline. See the commandline parameter section for more details.

The configuration file is a straight-forward ASCII text file and can be created and edited with any simple ASCII text editor. Be sure you save the file in ASCII, though. Control characters added by some word processors will cause trouble.

The format of the file is free format, for the most part. Any lines beginning with the characters @ # % * or ; are ignored and can be used as comment lines. Blank lines are also ignored and can be interspersed as desired for readability. Keywords are case insensitive; you can use upper, lower or mixed cases, as you prefer. Spaces between keywords and parameters are also ignored.

TITLE
Everything after the space following the keyword TITLE is used as a title for screen display on the top line. You put whatever you like here, if you leave it out a line identifying the software will be used. The line should be less than 80 characters to display properly.

PORT
The parameter following the keyword PORT is used to determine which serial port is to be used. At present the only acceptable values are 1 and 2, for COM1 and COM2, respectively. If you leave this out, the default value of COM1 is used. It can also be over-ridden by a commandline parameter.

BAUD
The parameter following the keyword BAUD determined the baud rate used for serial i/o. Valid numbers are 300, 1200, 2400, 4800, 9600, and 19200. If no valid value is used, 1200 baud is assumed. This can be over-ridden by a commandline parameter.

MONITOR
The MONITOR keyword is used to determine whether you want to monitor serial port data or not. When used with a TNC, setting MONITOR to ON lets you see what is happening on the channel. Valid parameters are ON and OFF; the default is ON.

TERMINAL
This keyword determines whether FE is initialized in TERMINAL mode or not. If set ON, FE will act like a dumb terminal program. For use with a PBBS, this is normally set OFF. Valid choices are ON and OFF; the default is OFF.

SOUND
NOSOUND
These keywords determine whether Ctrl-G (Bell) characters make a sound or not. If SOUND is used, whenever a Ctrl-G is monitored, a beep will sound. The default is NOSOUND, which ignores Ctrl-G's in monitored data.

EVENT
This keyword is used to specify the schedule used by FE. The following parameters specify the Days which the event is to be active, the start and stop time for the event, configuration to be used during the time period, and several DOS Errorlevels to be used on exit from FE during the time period. Valid Days are Mon, Tue, Wed, Thu, Fri, Sat, Sun, and All, however only All is guaranteed to work properly at present. Start and stop times are specified in 24 hour

format. The first event should begin at 0000 and the last one should end at 2400. Overlapping times are not recommended.

The exit codes are specified in the form <X>=<N>, where <X> indicates the exit condition and <N> indicates the DOS Errorlevel to use on exiting. Note that DOS uses several errorlevels for its own purposes, so exit errorlevels less than 10 are not recommended. Valid exit conditions are I, which specifies an exit at the beginning of an event, B, which specifies an exit to load the BBS software, and M, which specifies an exit after recieving a mail transfer. It is up to your batch file to determine what actually happens when an exit occurs.

COMMANDLINE

When FE is executed, it is able to determine some of it's parameters from the DOS commandline. The general form of the commandline is:

```
FE [configfile] [-P1|2] [-Bn]
```

Note that all parameters are optional.

The first parameter allows a configuration file other thatn the default FE.CFG to be used. If you want to use the default FE.CFG, do not specify any configuration file on the commandline. The remaining parameters can appear in any order, but must begin with either a - or / character.

The P parameter allows you to over-ride the port specified in the configuration file. Valid parameters are -P1 or /P2 to select COM1, and -P2 or /P2 to select COM2.

The B parameter allows you to over-ride the baud rate specified in the configuration file. Valid values are 300, 1200, 2400, 4800 and 9600. For example to select 4800 baud, use -B4800 or /B4800.

I'm new to packet and don't know how to recognize what is appropriate.
There is a local station that sends unconnected packets with an
occasional message imploring people to pray for and condemn the "slaughter
of the unborn" in a reference to abortion.

Is this sort of thing legal? Does the FCC allow packet braodcasting or look
the other way? The other station contends that since the message isn't
obscene he has a right to send it. Is packet on the regulatory frontier or
do I need a new license manual?
Thanks!

I'm trying to get hold of the latest version of NET/Mac. On ucsd.edu
there is a patcher program which will take version 2.3.19 to 2.3.20
but the latest version that appears to be available anywhere on the
Internet (according to Archie) is 2.3.15. So does anyone have either
version 2.3.19 or 2.3.20 that they could e-mail to me, or alternatively
a pointer to an FTP site where I can get either of these versions ?

Thanks,

//Paul (G4BWQ)

In the UK, that's definitely extremely illegal, the use of amateur radio for political and religious purposes is expressly forbidden. It damn well should be in the US as well, but owing to all the flag-wavers shouting 'First Amendment' all the time and whining about rights, it probably isn't.

Sorry for minor flame, but use of packet for that sort of thing annoys me no end. That's not what amateur radio is for. It's on the same line as in the UK, some stations contending that they have a right to send whatever they want over the network because they have a license - which is of course wrong, as the wonderful network we have is all courtesy of the operators who allow others to use their equipment. Talking about having a 'right' to do with other people's equipment exactly what you wish, er, also annoys me no end. Ho hum.

Gosh, I am a bad-tempered sod..

Same in Australia too. It would also be classed as "broadcasting"
(which is also illegal), but I guess you could get around that by
setting your UNPROTO to "CQ" ...

I don't know why some people have to be obnoxious about their "right"
to "free speech", whatever that is.

The only item I've seen the FCC take action on was a political message
that including a 1-900 (surcharge) number for callers who wanted to
register againt the Gulf War. The violation was for business traffic, not
for broadcasting.

It probably is not, when it all boils down, illegal broadcasting. It can
be compared to your making your unproto "N0IRR> STAY ALIVE-DONT DRINK AND
DRIVE."

97.3(10), 97.113(c) and 97.113(a) cover your question -- the situation you
described is simply legal.

:   containing 90 degrees hybrid phase splitter and two balanced mixers,
:   it is easy to do so. And the catalog says "Low Cost".
:   I am interested in using them. Anyone used? How much did it cost?

I'm not sure of IQ modulation in conjunction with the two parts you
mention but I've had very good luck at building an IQ modulator for
1200 MHz directly on PC board.
  My next phase of high speed radios use direct conversion and spread
spectrum on the 1200 MHz band. I've been able to achieve 20-30 dB of
balance and similar error vector magnitude errors over 1200-1300 MHz for
a few cents worth of board material and a dollar's worth of surface
mount diodes and chip resistors.

  Generally, narrowband quadrature networks aren't difficult or
expensive to make. At low frequencies lumped elements work fine and at
vhf a combination of transmission lines and lumped elements work. I've
had good success around 100 MHz this way.

  Let me know more details of what you need and I'll try to recommend
something.

Jonathan,
Volume 15 is ready to go out the door in 2 days. I'm not sure if
anybody is saving them at an archive, but I've gotten enough
requests that I'm considering just reissuing them again -- kind
of like a FAQ.

Various versions of JNOS seem to work differently here. It is in continuous development and as bugs get fixed, new features add new ones. Have you tried the distributed executable and does it have the same problems? This is probably about at its limit for using TC. I'm compiling with BC++ 2.0 and have occasional problems. BC++ 3.1 apparently works best and is what Johan and most of the other code writers are using.

>I don't have pklite. Is this a major problem, and if so, are there any
>options? What exactly does pklite do?

PKLITE compresses the size of the executable on the disk, but it expands when executed and still requires as much memory.

>Is there a trick to downsizing NOS other than modifying config.h??

Try an older version, such as 1.01, if you are really against the limit and don't really need all of the newer stuff.

>Also, I am curious about the MULTITASK feature. Does this mean that when
>shelling to DOS, NOS continues to run?

Yes, but there isn't enough memory to do much else when shelled out.

You might check out the mailing list nos-bbs@carleton.ca (send a message to listserv@carleton.ca -- I don't remember the exact format, but I don't think it's really a robot, so that may not matter). There are a lot of hints and other good information there.

Seems very clear to me it's illegal:

97.3 (a)
(10) Broadcasting.
Transmissions intended for reception by the general public, either
direct or relayed.

(23) Information bulletin.
A message directed only to amateur operators consisting solely of
subject matter of direct interest to the amateur service.

97.111 (b)
In addition to one-way transmissions specifically authorized elsewhere
in this Part, an amateur station may transmit the following types of
one-way communications:
..

(6) Transmissions necessary to disseminate information bulletins.

97.113 (c)
No station shall transmit communications in order to engage in any form
of broadcasting, ...

The ARRL Rule Book (not FCC regulations, but read and approved by FCC)
says:

"Permissible one-way transmissions include ... bulletins of interest to
amateurs only and code practice such as that transmitted by W1AW ...
According to the rules, the content of bulletins must be limited to
matters of direct interest to radio amateurs only, and never intended
for the ears of the general public. ... Information bulletins by
definition must be confined to factual matters, not matters of opinion."

I find myself in a strange position..... here's this guy in Great Britain
telling us what we, in the Colonies, should be doing.

Sure, we'll do it! Just stand up a little taller so I can see who I'm
agreeing with.

=====

Actually, I do find myself agreeing with parts of what you say, but
strongly not with other parts.

Will this become a thread?

Probably not.

73,
Dave

Wow! I've been flooded with feedback from the Internet issue of
the MiniSport Laptop Hacker series. Rather than pile a whole bunch
of individual resends to specific e-mail addresses, I think it would
be more prudent to just reissue them again into the two newsgroups.

If you are an archive site or know of one who handles this type of
information, please feel free to save up the MLH series and serve

users in your area. If you use the MLH series to make money or
to assist making money, honor the copyright and query me before
proceeding. Thanks.

If you're "just" a normal Internet user and you're interested, please
watch for the issues in the two newsgroups this was posted to. If you
let one or two slip by or they expire too fast on the system you use,
ask your host to archive them or point you to an archive server. It
kills me spend half the time re-sending previous ones and half the time
writing new ones. I *want* you to get all the information, but as
more issues go out, these requests geometrically slow the next issue!

MiniSport Laptop Hacker - Vol 1

As some of you may know, Zenith has gotten out of the business of selling
personal computers. I had the good fortune to purchase some of their ex-
tremely small MiniSport laptop computers. They are absolutely perfect for
packet use and in any RACES or ARES setup, they could provide other func-
tions as backups due to their universal hardware platform. I thought oth-
ers might be interested in information I've collected in case you're using
one or interested in buying one.

If *you* have information, please pass it on to me. I'll bundle it up and
send out a MiniSport Laptop Hacker Part 2!

These computers are basically an IBM/PC platform with 1 or 2 Mbytes of RAM,
MSDOS 3.3 in ROM, a 2" floppy, and a 25x80 column LCD screen. RAM above
640k can be used for EMS or battery backed RamDrive. They have connections
for an external CGA monitor, an external floppy, serial port(s), and a par-

allel port. Primary connection to other computers is via a 3-wire or 7-wire (faster baud rates) null-modem cable. FastWireLink program is included in ROM with MSDOS, logically on drive C:

The 2" disks are hard to locate, but I finally found a source for them, albeit an expensive and un-friendly one: Rex Television Service Co., phone 708-448-5558.

I had a power supply problem with one. I unscrewed the case and innards of the offending unit and learned a lot. The interior is modular and easy to work on: Power supply, Main CPU board, Keyboard, Disk Drive, and LCD display. Multiconductor ribbons connect the parts. If you open yours up and slide the main PC board out, be carefull of the POWER SWITCH and the disk drive EJECT BUTTON. Both get caught easy on the case and might snap something. The only tricky part is that one of the drive mounting screws needs to be unscrewed before you can release a thin piece of copper ("Mu metal") colored grounding strap wrapped up and around the main PC board from below.

Like I said, I had a power supply problem with one. To the best of my knowledge, it's an intermittent cable contact. Each time it fails, unconnecting & reconnecting the one PS cable fixes the problem. It's a 15 min operation and is not complicated. I'm thinking of swapping power supplies around. I have the pinout of the PS connection to the main board, if you're interested. You could test the PS by only taking off the bottom computer panel and measuring voltages from the "underside" of the circuit board.

The unit is powered by a removable battery that reminds me of a cam-corder battery. It's advertised to be 6v. I suspect it's five NiCd cells (5x1.2 => 6.0). The computers power supply/ charging receptacle is on the battery pack and feeds connections further into the computer. I've tapped into the wierd shaped connector with paper clips. Alternately one could bypassed the battery entirely by clipping alligator clips onto the sliding contacts on the computer. The batteries will charge with a 6volt supply, but the computer runs from 9volts DC if it's not using batteries.

As I hinted above, a second serial port is available. It's logically there, but terminates mechanically in a Scotch-Flex type socket. It's meant to accept a modem module. I'm currently trying to determine a pinout for this connector. If you have the information already, perhaps you could pass it on to me.

The external floppy drive connector has been as difficult to find as the 2" floppy disks. It is a square outer connector, with a female D-shaped receptacle. The D-shaped receptacle has 20 pins. It's just under 3/16" tall and just under 5/8" wide (at the wider side of the D). If you have any PINOUT OR ACQUISITION INFORMATION for this type of connector, please send me a message and I'll include the information in round 2 of the MiniSport Laptop Hacker.

MiniSport Laptop Hacker - Vol 2

Remember to send me any hacker tips, resources, addresses, etc that you have so I can include them in subsequent MLH volumes. One correction from Volume 1 has been pointed out to me. The MiniSport is an IBM/XT compatible, not an IBM/PC compatible

I. MAXIMIZING BOOTUP CONVENIENCE AND MINIMIZING BOOTUP DISK SPACE

The bootup sequence on this computer is a little different than you're probably used to. Most MS-DOS computers will boot up on hard drive C:, looking for the CONFIG.SYS and AUTOEXEC.BAT files in the C: root directory. If the CONFIG.SYS isn't there, nothing special happens. If the AUTOEXEC.BAT isn't there, you will be prompted for a time and date entry.

The first, biggest difference on the MiniSport, is that you can choose your boot device. Normal MSDOS always tries the first floppy, then goes to hard disk. With the MiniSport, you can choose to boot from 2" floppy disk, the internal ROM disk C:, the external floppy disk plugged in the back, or ROM disk D:. Lots of choices!

The least used is probably booting from an external drive. I know where they are available for about $125, but this price is higher than the street price of the entire computer, so not many people have them. Booting from the built in 2" disk is similar, and more economical, since these disks are available for $4-$6 each. With either selection, the disk must be formatted and prepared with the MSDOS SYS.COM utility.

Booting from RAM disk D: gives you some flexibility. You can create and

store CONFIG.SYS and AUTOEXEC.BAT files in the root directory of D:, and they'll be used during bootup. If AUTOEXEC.BAT is not there, you will be asked for date and time. The situation involving CONFIG.SYS is a little bit more complicated, however. If you boot from D:, the boot routine will look for a command processor (COMMAND.COM or one of your choice) on disk D:. It's kind of disappointing to have to keep a copy on disk D:, since there's one permanently available in ROM on disk C:. To use the one over on C:, the non-boot disk, you need to include a SHELL command in CONFIG.SYS. It might look like this:

```
SHELL = C:\COMMAND.COM /P
```

The "P" option tells it to stay permanently in memory; the MSDOS command EXIT will not exit from the command processor. This gave me some trouble because the COMPSEC variable (type SET at the DOS command line to see all variables) was not getting properly set. This may be a bug in the MiniS-port firmware. Does anyone else notice that when booting on C: or D:, specifying or not specifying a command processor with SHELL, COMPSEC doesn't get set correctly?

My preference is to boot from ROM disk C:. The unpredictable part is that when booting from C:, AUTOEXEC.BAT and CONFIG.SYS from disk D: are used. In this case, no SHELL command is required (hence no CONFIG.SYS file unless you need it for other reasons) since COMMAND.COM is already available on the default boot disk. The only line "necessary" in the AUTOEXEC.BAT file is "d:" to switch over to disk d: for the first command line. Even that is only necessary if you *want* to be over on disk D:

Personally, I use no CONFIG.SYS and the following AUTOEXEC.BAT on D:

```
@echo off
echo BjM (Opus-OVH) P autoexec.bat
path c:\;d:\util;d:\
prompt $p$g
verify on
d:
```

Let me know what parts of the MLH series are useful to you. Pass on your hints and pointers so others can benefit.

MiniSport Laptop Hacker - Vol 3 19 Nov 1992

Thanks for all the feedback! I heard from W4NQB, N2BQF, W6QJM, NI9X, N2PBU, N9LNO and KB1UM. Several comments indicated that the discussion of COMPSEC, boot drives, etc was too complicated or too confusing. I'll give a clearer, more concise rendition in the next volume.

In this issue, two topics are covered:
1. Building your own null modem FWL (FastWire Link) cable.
2. Discussion of "extra" DOS files Zenith put on your disk C:

1)
If you have a MiniSport, you *need* a null modem cable to make the computer useful. You can purchase a null cable for about $10, but if you're a ham, you probably have parts to make your own. A cable with *three* terminating plugs adds tremendously to the convenience of hooking up to unknown "host" computers you may run across. The following diagram shows the way I wired one that has worked for me:

Hook the lone 9-pin into your MiniSport serial port and then use either a 9-pin or the 25-pin connector on the other with the host MSDOS serial port. Of course, the host could just be another MiniSport.
FWL will work successfully with this three-wire cable. The on-line help indicates that a full 9-wire null modem will allow faster transfer due to hardware handshaking. FWL checks and brings up the transfer speed to the maximum possible. This 3-wire cable is sufficient, however.

2)
I believe the following to be a complete list of extra "Zenith special" programs that are resident on your ROM drive C:. If you've never looked at this list before, you're probably missing some fun! I have no manuals for any of this. The comments I'm making are from experimentation only. If you have manuals, copy this list, make corrections to my comments and send it back to me!

APPLY.COM - Repetitive DOS commands by typing on the changing part.
BOOTF.COM - Lets you reboot the system from floppy.
EMM.SYS - Expanded Memory Manager (I use all mine as a drive, however)
FWL.EXE & FWL.HLP - FastWire Link to transfer to and from another computer. * C a u t i o n * Don't port FWL over to a computer that has a disk partition beyond the original 32 MByte MSDOS limit. I did this and succeeded in scrambling the directory when that computer received files. The only safe way to transfer to a 32 MByte+ formatted machine is to use only floppies for the transfer, and then do a local copy from floppy to hard drive.
GDU.EXE & GDUTSR.COM - General Disk Utilities. They work on other machines, but I have not figured out how to use the TSR version.
MACHINE.COM - This lets you make "post bootup" changes that otherwise would have to be made with the SETUP utility prior to boot.
NOSTACK.COM - I'm not sure what this does. Any comments?
SEARCH.COM - A global (all directory) search for a filename.
ZCACHE.SYS - A disk cache program. Has anybody ported this to other machines?
ZDIR.SYS - A complete, but compact directory (dual columns). Port works.
ZSPOOL.COM - A printer spooler. So how is this so much better than the old fashioned MSDOS PRINT utility?

And these are the MSDOS 3.3 files you *don't* have:
EGA.CPI
FASTOPEN.EXE
FDISK.COM
GWBASIC.EXE
RAMDRIVE.SYS
SHARE.EXE

I recently succeeded in unsoldering the 1 Mbyte SIPP from one computer and grafting it into a second. More info on that, squeezing a lot into a 2 MB ramdrive, and a clearer description of minimum boot files -- in Volume 4.

I want to compile a listing of all current domain addresses worldwide,
along with their IP addresses, and place the information into one
master file.

Also, is there a mailing list or someplace where this information in
posted? I have full usenet access, along with full Internet access, too.
Is there an Internet FTP site which has the information?

I've tried FTPing it from a local Amateur TCP/IP station, but when I
finished the transfer (a zip file, and I did transfer it as a binary),
my copy of pkunzip could not recognize the file (I have pkunzip v.2.04g).

Thanks much for your help.

I'm in the midst of studying for my Technician license, and am planning
on using mainly packet. What I need to know is how I can make a packet
node coexist with the rest of my net here at home. I have my own domain
name (smy.com), and my own class C network address, and Thin-net running
between my three machines. Does a packet node running TCP/IP have to be
in the ampr.org domain? I think the DOS 386 will probably be running NOS
and routing to the other machines on my net (486/Unix & Mac LC). I don't

want to route between Internet and Packet or vice versa, just between machines in smy.com and machines in ampr.org.

Anybody have any hints on how this can/should be done? Anybody know where I can find more info on the subject?

Thanks.

Steve

I just passed my tests to get my Tech+ ticket. Now I'm looking to get an HF rig. I'm very interested in HF packet, and I would like some info on what to look for in a rig. Right now I am looking at the Icom 728 or the Yeasu 747. I am more impressed by the specs on the Icom, but the Yeasu claims to have a 100% duty cycle. I've read in some piece of literature that for HF packet a good duty cycle is needed, so is 100% duty cycle nessicary? Also are most HF digital modes on SSB or would an FM option be a good investment, what about that AFSK? Any other info along these lines would be helpful.

So anybody running HF digital modes let me know what you think and/or let me know what rig you use. Thanks alot.

This is a thank you message to everyone who sent replies regarding
my previous message of where to get the domain.txt file for the
IP addresses.

For those who are interested in the results, the answer is:

the ampr files are located in /hamradio at ucsd.edu.
i.e. ftp ucsd.edu, cd /hamradio

Why? You can't get to every 44/8 address. You can only get to the
ones that have access to a gateway.

>Also, is there a mailing list or someplace where this information in

An official, but not necessarily up to date list is kept on UCSD.EDU
in the hamradio directory. It is called ampr.org or something similar.
You should also find a list of local ampr.org coordinators.

No. You can run KA9Q nos with any IP address, not just a 44. address.

I think the DOS 386 will probably be running NOS
>and routing to the other machines on my net (486/Unix & Mac LC). I don't

>Anybody have any hints on how this can/should be done? Anybody know
>where I can find more info on the subject?
>

Simple. Put an ethernet card, and a serial card in your PC. Configure the
TNC port to have a 44.x.x.x address. Configure the ethernet port to have a
compatible ip number for your subnet. Setup a route in nos so it can find
both ports.

Configure your sym.com machines to point to the ka9q machine for 44.x.x.x
All of your friends will have to add an entry for you, else they would
be able to get past the nos gateway.

Since the 'real' router (your internet link) knows nothing of your 44.x.x.x
gateway, people wouldn't be able to get packets through it, yet it will work
fine for your machines.

I did this here, and it worked fine.

I am considering getting either the MFJ 1270 or the KPC3. Does anyone
know how well they work on TCP/IP? Also, can the KPC3 be upgraded
to 9600 baud?

   Hello all!

     I'm in Washington DC and am studying for my New Voice Novice exam.
I'd like to know-

   1) How long the question pool that I'm studying will be used in the
exam (It's question pool effective July 1,1990). Will it be useable in
July? I plan to take the exam in July.

   2) Are there any General Class hams in the DC area who could test
me?

       Thanks.
                     Patryk

Oooohhh... Sorry, that question pool will expire June 30. The new pool is
available from the ARRL mail server (mail 'info@arrl.org' with 'help' in
the body for more info on the mail server).

>   2) Are there any General Class hams in the DC area who could test

>

Oooohhh... Sorry #2, Novice tests will only be given under the VE system
as of July 1. The good news is that the ARRL VEC will not be charging the
usual $5.60 for Novice license tests. A schedule of upcoming exams can be
obtained from the ARRL as above.

I am using a KPC3 (KISS Mode on FBB5.15) also using KPC3 for the paKet
Terminal Program written by Tony Lonsdale. There are some slight
differences in the firmware between TNC2's and the KPC Group. All in
all, I have found it a very reliable TNC. Yes, it does work on 1200
baud.

Best bet from a cost point is to use the BayCom Modem for TCP/IP. I have
used it, and it works extremely well. If you are technically inclined,
it is very cheap to build. I am sure that the KPC3 can be upgraded, I
haven't heard of one with an upgrade.

Subject: looking at HF packet rigs
To: packet-radio@ucsd.edu

     I just passed my tests to get my Tech+ ticket. Now I'm looking to
get an HF rig. I'm very interested in HF packet, and I would like some info
on what to look for in a rig. Right now I am looking at the Icom 728 or the
Yeasu 747. I am more impressed by the specs on the Icom, but the Yeasu claims
to have a 100% duty cycle. I've read in some piece of literature that for HF
packet a good duty cycle is needed, so is 100% duty cycle nessicary? Also are
most HF digital modes on SSB or would an FM option be a good investment, what
about that AFSK? Any other info along these lines would be helpful.

     So anybody running HF digital modes let me know what you think and/or

let me know what rig you use. Thanks alot.

From: unix.sri.com!hsdndev!dartvax!Kenneth.E.Harker@hplabs.hpl.hp.com
Subject: Packet newbie here...
To: packet-radio@ucsd.edu

     I'm a "call-sign pending" tech plus who just passed the exams
about three weeks ago. One of the first things I want to do when I get
my ticket is get up and running on packet. I'm going to have a 2m
handheld on loan for a while, but I need a TNC/multimode controller. I
really have no idea what to get.
     First, I wonder if I should get just a TNC or a full blown
multimode controller? I know I'll be interested in packet, but what I
don't know is whether or not I'll be interested in the other digital
modes. About how much more could I expect to pay for a multimode than
for just a TNC?
     Another question is size. Living in fraternity/dorm rooms for the
next two years will mean that whatever I get is better small.
Eventually, I might even like to do a palmtop packet station, so that
also puts a premium on size, and ideally, it should be capable of
running on both batteries and AC or DC power. Although I know that
most packet activity is still at 1200 baud, should I consider getting a
2400 baud TNC, or even a 9600 baud one?
     Another concern is an external antenna. I can put a vertical on
the roof of my fraternity house, but I may in the future be living in
dormitory rooms as well, so I wouldn't mind advice on either a good
outdoor antenna or an indoor antenna that can fit well in a dorm room.
     I know that I'm asking a whole lot of questions, but I really
would appreciate any advice on these issues. I'm really excited about
getting on the air soon.

73,
_ken

p.s. one last request: does anyone know of a good mail order
company(ies) I can get a free catalog from? The closest ham radio
store to here is a 4 hour round trip.

From: mnemosyne.cs.du.edu!nyx!psthomas@uunet.uu.net
Subject: WANTED: MFJ1274 or equiv
To: packet-radio@ucsd.edu

  Well, I haven't had much response from my other article on this subject, in other groups... Maybe this is the best place for it...

  I'm looking for an MFJ1247 or an equivalent TNC. I'd like to be able to use ka9q software with it, and I'd like to have HF and VHF capabilities. A mailbox would be nice, too. This should all be standard equipment on the MFJ, and I'm not an expert on other brands, so please let me know if I should look for some other brand that might allow me additional features. I'm looking to spend 60-80 dollars, depending on condition, and options. New, these go for about $120, so I think 50% to 66% isn't a bad price for used equipment. I'm somewhat flexible, so let me know. Also, if I've made any errors in judgement (regarding standard features, prices, etc), please correct me!

  Thanks in advance!

  - Patrick

Subject: Packet and the *real* Internet
To: packet-radio@ucsd.edu

I'm in the midst of studying for my Technician license, and am planning
on using mainly packet. What I need to know is how I can make a packet
node coexist with the rest of my net here at home. I have my own domain
name (smy.com), and my own class C network address, and Thin-net running
between my three machines. Does a packet node running TCP/IP have to be
in the ampr.org domain? I think the DOS 386 will probably be running NOS
and routing to the other machines on my net (486/Unix & Mac LC). I don't
want to route between Internet and Packet or vice versa, just between
machines in smy.com and machines in ampr.org.

Anybody have any hints on how this can/should be done? Anybody know
where I can find more info on the subject?

Thanks.

Steve

>in the ampr.org domain?

No. You can run KA9Q nos with any IP address, not just a 44. address.

I think the DOS 386 will probably be running NOS
>and routing to the other machines on my net (486/Unix & Mac LC). I don't
>want to route between Internet and Packet or vice versa, just between
>machines in smy.com and machines in ampr.org.
>
>Anybody have any hints on how this can/should be done? Anybody know
>where I can find more info on the subject?
>

Simple. Put an ethernet card, and a serial card in your PC. Configure the TNC port to have a 44.x.x.x address. Configure the ethernet port to have a compatible ip number for your subnet. Setup a route in nos so it can find both ports.

Configure your sym.com machines to point to the ka9q machine for 44.x.x.x
All of your friends will have to add an entry for you, else they would
be able to get past the nos gateway.

Since the 'real' router (your internet link) knows nothing of your 44.x.x.x gateway, people wouldn't be able to get packets through it, yet it will work fine for your machines.

I did this here, and it worked fine.

check out this months issues of CQ and QST. one of these (can't find mine
right now) has an article on a portable 2-meter antenna using pvc and some
wire. seems pretty lowcost, portable (hang out the window whey you want to
use it) and a good first project if you are into that. one word of caution
about this though...check and see what the interference is from the tnc that
you get. i have an mfj 1270b and it is so noisy that the only way i could
get a reliable connection to the bbs was to put the antenna on the roof.
also, make sure that the system is grounded for the rf stuff.

welome to ham radio. enjoy whatever niches you find and don't be afraid to
at least give other areas a try. you just might like it.

Multimodes command about a 3X premium over TAPR clones. It's not worth it unless you intend to operate a lot of HF, which, of course, also demands a HF rig and antennas.

>   Another question is size. Living in fraternity/dorm rooms for the

>2400 baud TNC, or even a 9600 baud one?

PacComm has the Micropower TNC which is all CMOS, and still TAPR compatible. It's power requirements let you operate battery portable. There are also smaller TNCs like the Handipacket, but they are based on proprietary designs and aftermarket firmware and hardware aren't available. You should plan on eventually going to a higher speed modem, but that's very location dependent. Find out what's current in your area. It does no good to have a 9600 baud modem and find no one to converse with. Having a TNC that's TAPR TNC2 compatible is very useful because it means that changing to a higher speed modem is a drop in operation via the modem disconnect header. Not all TNCs have this. Also 9600 baud will likely require radio modifications, and not all radios are easily modified. 2400 baud shouldn't have this problem, but the throughput improvement is not nearly as much as you'd expect due to the half duplex nature of packet with it's fairly long turnaround times. Unless it's a local favorite, I'd say don't bother with 2400 baud.

>   Another concern is an external antenna. I can put a vertical on
>the roof of my fraternity house, but I may in the future be living in

>outdoor antenna or an indoor antenna that can fit well in a dorm room.

The best external antennas price/performance wise are the Comet and Diamond lines. Avoid the Cushcraft Ringos unless someone *pays* you

to take it. :-)

For indoor antennas and HTs, the AEA Hotrod is good, but you'll find
that HTs and packet don't mix that well unless you use a remote
antenna. Usually a mobile magmount stuck on a filing cabinet will be
fine. The problem is RF feedback into the TNC, and TNC hash getting
into the HT. A separate antenna should be considered a must have option.

>p.s. one last request: does anyone know of a good mail order
>company(ies) I can get a free catalog from? The closest ham radio
>store to here is a 4 hour round trip.

Amateur Electronic Supply, get on their mailing list. You'll find
their ad in any QST. HRO and a few others also offer catalogs, but
QST is *itself* a catalog, so if you subscribe, you don't really
need any of the others.

This is a thank you message to everyone who sent replies regarding
my previous message of where to get the domain.txt file for the
IP addresses.

For those who are interested in the results, the answer is:

the ampr files are located in /hamradio at ucsd.edu.
i.e. ftp ucsd.edu, cd /hamradio

>any errors in judgement (regarding standard features, prices, etc), please
>correct me!

The MFJ1274 is a good choice for a TNC primarily used at VHF with some
limited HF operation. While the later standard firmware has a KISS mode,
most TCP/IP users replace that with the K3MC KISS_ONLY ROM image. That
gets rid of features like the mailbox (only available with the latest
firmware anyway, beware of used purchases in this regard) which is
redundant with TCP/IP. If you're primarily interested in HF operation,
the MFJ1274 is a less good choice. Then you should be looking at
multimode units like the PK232 and KAM which have superior HF filters.
Note that these are less than stellar performers with TCP/IP, however,
since you're stuck with their proprietary firmware which has arbitrary
limits on packet size. Also, adding higher speed modems is difficult
to impossible with these proprietary boxes. Since the MFJ is a true
TAPR clone, addition of high speed modems is straight forward.

Subject: WANTED: TCP/IP domain.txt files wanted
To: packet-radio@ucsd.edu

I want to compile a listing of all current domain addresses worldwide,

along with their IP addresses, and place the information into one
master file.

Also, is there a mailing list or someplace where this information in
posted? I have full usenet access, along with full Internet access, too.
Is there an Internet FTP site which has the information?

I've tried FTPing it from a local Amateur TCP/IP station, but when I
finished the transfer (a zip file, and I did transfer it as a binary),
my copy of pkunzip could not recognize the file (I have pkunzip v.2.04g).

Thanks much for your help.

Why? You can't get to every 44/8 address. You can only get to the
ones that have access to a gateway.

>Also, is there a mailing list or someplace where this information in

An official, but not necessarily up to date list is kept on UCSD.EDU
in the hamradio directory. It is called ampr.org or something similar.
You should also find a list of local ampr.org coordinators.

I am wondering if anyone has an estimate of the range of thruput for
packet connections on 1200 Baud relays. For example, two stations
operating 1200 with "perfect" conditions: (no retries and reasonable
FRACK) vs two stations where there are multiple retries or a digipeater
between them. I suspect the range for the first case is about 60-70%
efficient vs a phone modem, whereas the second case loses another 20%
or so. Any gut feeling on this from the readers??? 73, Dave (KN2M).

   Hello all!

     I'm in Washington DC and am studying for my New Voice Novice exam.

I'd like to know-

   1) How long the question pool that I'm studying will be used in the exam (It's question pool effective July 1,1990). Will it be useable in July? I plan to take the exam in July.

   2) Are there any General Class hams in the DC area who could test me?

       Thanks.
                       Patryk

> July? I plan to take the exam in July.
>

Oooohhh... Sorry, that question pool will expire June 30. The new pool is
available from the ARRL mail server (mail 'info@arrl.org' with 'help' in
the body for more info on the mail server).

>   2) Are there any General Class hams in the DC area who could test
> me?
>

Oooohhh... Sorry #2, Novice tests will only be given under the VE system
as of July 1. The good news is that the ARRL VEC will not be charging the
usual $5.60 for Novice license tests. A schedule of upcoming exams can be
obtained from the ARRL as above.

I am using a KPC3 (KISS Mode on FBB5.15) also using KPC3 for the paKet
Terminal Program written by Tony Lonsdale. There are some slight
differences in the firmware between TNC2's and the KPC Group. All in
all, I have found it a very reliable TNC. Yes, it does work on 1200
baud.
>
> I am considering getting either the MFJ 1270 or the KPC3. Does anyone

Best bet from a cost point is to use the BayCom Modem for TCP/IP. I have
used it, and it works extremely well. If you are technically inclined,
it is very cheap to build. I am sure that the KPC3 can be upgraded, I
haven't heard of one with an upgrade.

    I like the MFJ-1270B because it's a TNC-2 clone. Most of the 9600b
modems and DCD mod kits are made to work (fit into infact) the
TNC-2 clones. I doubt that the KPC-3 is a TNC-2 clone and since it
is smaller than most 9600b modems, you'd have better luck puttting
the KPC-3 in a 9600b modem case than putting a 9600b modem in the

KPC-3. Also with the MFJ-1270B, you can put in a ROSE, TheNet, KISS-ONLY, upgraded KISS (if any) and other EPROMS that work with the TNC-2. With the KPC-3, you have to hope that the author of the software thought enough of the KPC-3 or Kantronics stuff to make a special EPROM image for it.

Also, if your going to run TCP/IP at 9600b, you'll probably want to look at getting a SCC board and attaching the modem directly to it. You don't need a TNC-2 to do 9600b and they don't keep up at 9600b very well anyway. The 9600b modem bypasses most of the stuff in the TNC and KISS bypasses most of what remains. A SCC card takes care of the rest and it does it better than a 9600b or 19200b serial link. Most people start off with a TNC-2 to do 9600b and then go to the SCC cards. The SCC cards will also do 2 9600b modems. Course, I haven't got any 9600b stuff working yet so maybe I'm off base. I hope to have a 9600b link (using MFJ-1270b tncs) going soon. I'll look at the SCC option then.

I'm not 100% sure, but I'd be surprised if the KPC-3 is upgradeable, at least speed-wise. The Kantronics boxes do the HDLC'ing in software and the processor is just not up to handling speeds much above 2400bps. There are 2400bps modems available for the other Kantronics boxes (KAM, KPC-2) but I don't think they will work with the KPC-3. If you want to run faster, go with an MFJ 1270 or a PK-88...either can be found used for less than a new KPC-3.

My $0.02 worth...

I have seen references to software and/or TNC firmware for
networking ARES/RACES operations on packet systems during
emergencies. I would like to find out as much as possible about
such software/firmware. Can anyone supply me with the software or
pointers to it?

Thanks.

Could someone please e-mail directly to me, or post to the net, all
the Internet -> TCP/IP packet gateways. I would like to be able to
telnet or FTP into a TCP/IP site from my Internet account.

Thanks in advance.

73,
Scott

Hello Everyone...

I'm looking for a TNC in "kit" form. Cost is a consideration, but not a
limitation....

Also, please reply with comments on the different TNC's both kit form and other

that are available ...

I'm interested in packet, just don't have a feel for what to look for!!!!!!!

Thax In Advance ...

>

Back in northern New Jersey, on packet it seemed at times I was getting
less than 100 baud thruput annoyingly often. But I was on the inner
fringe of the systems (RATS on '.07) I was using. With about 4Watts.
Here in silicon Valley, also on '.07, I appear to be very close to my
home board, and the traffic is light. I get thruput somewheres around
700 baud. A little faster than I can read, on average. (I estimate
my reading speed at around 600 baud).
New Jersey seemed to have a lot more traffic on '.07 than here in
Silicon Valley.

The Utah County ARES/RACES group has been using packet for
emergency communications for several years now. We have
developed some specialized terminal emulation software
to do it. The software is free to groups using it for amateur
emergency communications.

There has been enough interest, that I feel I should
post it somewhere.

Is this an appropriate place?

Mike,
   What do you need to know about it? I don't know of any online
docs. I'll be glad to try to answer any of your questions. If you
want to get to the Texas TexNet network from the Internet send a
note to kf5mg@kf5mg.ampr.org and we can discuss it.

I just talked to the author of our ARESPACK packet radio terminal
software about posting it to the net.

His reply was "That's great! But hold off a week." He is in the
process of doing a "Latest-And-Greatest" revision on it, and wants
me to post the new version when it is done.

In the mean time, where would the packet community like to see it
posted? I would like to either post a UUENCODED copy here, or
put it somewhere for anonymous FTP. If there is enough interest,
(and I've already had several requests), I think here would not
be a bad place for it. In any case, would someone like to offer
to be an FTP archive site for it?

I just purchased the Alinco DR-1200T, my first radio bigger-than-a-handheld.
I'm going to need a power supply; but Ham Radio Outlet says their
"least expensive" would be $109.

Is that ridiculous? (a real question) What should I expect to pay?
Does anyone have a power supply that they would give/sell to me
for a lot less?

Hello all,

I've been trying to get jnos1.09 compiled for a 386 machine with the SCC driver. There is a problem with the code for the scc driver and I'm trying to locate a copy of the fix.

Any and all help would be appreciated. Thanks!

I'd like to see it made available, but I don't think it should be UUENCODEd
and posted (there's a discussion in the news.newusers.questions FAQ of why
that's undesirable). If it must be posted, one of the binaries groups
would the place for it.

Several ham-related archives are listed in the rec.radio.amateur.misc FAQ.
One or more of them could probably serve as an archive site.

==========
KA9Q: NOSview RELEASE [304]
==========
by Ian Wade, G3NRW

NOSview [304] is now available via FTP on

```
        * * * * * * * * * * * * * * * * * * * * * * * *
        *   ucsd.edu:  /hamradio/packet/tcpip/nosview   *
        * * * * * * * * * * * * * * * * * * * * * * * *
```

Download the file:

```
                    * * * * * * * * * *
                    *                 *
                    *   nosvw304.zip  *
                    *                 *
                    * * * * * * * * * *
```

NOSview, first introduced in September 1991, is an on-line documentation and runtime package for the KA9Q Network Operating System (NOS). It contains:

++

*** probably the only complete reference work anywhere that describes all of the commands to be found in the major NOS releases.

*** a TSR file viewer that lets you read the NOSview documentation on-line, without breaking out of NOS.

*** NOSgas: the "NOS Get-Away Special" -- a complete set of working NOS runtime software, based on the PA0GRI 2.0m release.

*** a complete set of templates for the NOS control files.

*** full details on how to get the book "NOSintro", which describes in detail how TCP/IP works and how to use KA9Q NOS. Ideal for beginners to TCP/IP (and more advanced users will find many gems of helpful information there as well).

++

NOSview [304] contains many new documentation files, and the template NOS control files match the listings in the book "NOSintro".

Extras include ....

- UUENCODE/UUDECODE file conversion utilities
- AX.25 Baycom Packet Driver
- KISS protocol documentation
- HOSTS <> DOMAIN conversion programs
- PCElm and ELM Mailers
- The Clockwork VIEW TSR file viewer

As NOSVW304.ZIP is quite large (around 700 KB), you may
prefer instead to get your copy by mailing a DOS-formatted
diskette (any size EXCEPT 360 KB) and return mailer to:

     Ian Wade, G3NRW
     7 Daubeney Close
     Harlington
     DUNSTABLE
     Bedfordshire
     LU5 6NF
     United Kingdom

Please enclose return postage as follows:

     United Kingdom: UK postage stamps
     Rest of Europe: 3 IRCs
     The Americas, Africa: 7 IRCs
     Rest of the World: 9 IRCs

(Any unused IRCs will of course be returned).

There is no charge for NOSview, so please do NOT enclose
any form of payment.

73 de Ian Wade, G3NRW

February 1993

P.S. If you would like full details of the book
      "NOSintro", please email me direct:

        ianwade @ dircon.co.uk

What about submitting it to SIMTEL20?

AX.25 is often referred to as being the basis of amateur packet radio.
Can anyone please answer the following questions.

1   Is the latest version of the spec for AX.25 available anywhere?

The copy I have is version 2.0 from 1984 and only contains section 2
Link-layer specification.

2   In the version of AX.25 spec that I have, repeater chaining is
intended to be obsoleted by a future layer 3 protocol. Does the current
version of AX.25 specify any such protocol, or has AX.25 remained a pure
layer 2 protocol spec, to be used with arbitrary layer 3 protocols?

The packet FAQ does not answer these questions.

Follow-ups are directed to rec.radio.amateur.digital.misc.

>
>Any and all help would be appreciated. Thanks!

The following was posted by pe1nmb@pe1nmb.AMPR.ORG (Erwin Lemmers) on
Thu, 20 May 93 19:31:21 UTC to the nos-bbs-group mailing list at
hydra.carleton.ca. I highly recomend this mailing list to anyone who

does their own JNOS compiles.

++
After investigating the SCC files I found the bug I mentioned earlier to
this group. When NOS 1.09 is compiled for the 8088 everything works
fine, but when you compile the code for a 80186 or higher NOS crashed
after receiving a packet comming in at the SCC port.

The problem can be easily fixed by changing the ASYVEC.ASM file.

```
CHANGE THIS at line 48 and 158
        push    ax              ; save user regs on interrupt stack
        push    bx
        push    cx
        push    dx
        push    bp
        push    si
        push    di
        push    es
        call    eoi

INTO THIS
;        push    ax              ; save user regs on interrupt stack
;        push    bx
;        push    cx
;        push    dx
;        push    bp
;        push    si
;        push    di
        PUSHALL
        push    es
        call    eoi
```

After making the changes recompile the file and it should be work. I've
NOS 1.09 running here for several hours, compiled for the 286.

Greetings
Erwin (pe1nmb 44.137.32.50)

Don't know about OS/2. For a DOS version... check out the NOSVIEW
package on UCSD.EDU. (There is a post on this list about it.) Not
only does NOSVIEW have some docs, but it has a complete TCP/IP
system with example setup files. I'm pretty sure that it has the
ax25.com BayComm Packet driver. If not, look for it on UCSD.EDU.
Ian's book (the NOSVIEW author) is really a good book for the
TCP/IP novice, I believe that you can get it from the ARRL. It comes
with NOSVIEW on a disk. (I think. You might check if you ask about
the book.)

Posted-By: auto-faq 2.4
Archive-name: radio/personal-intro
Revision: 1.4 06/30/93 12:04:14
Changes: new rec.radio.amateur.* newsgroups, cs.utexas.edu gateway

(Note: The following is reprinted with the permission of the author.
Due to the recent reorganization, it is also on a temporarily-

accelerated posting schedule as follows:

July   weekly
August   bi-weekly
September back to monthly)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 30 June 1993 to add the groups created during the latest reorganization vote and the description of the cs.utexas.edu gateway.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew

weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, has not been removed as of this writing, but it is obsolete, and you should use .digital.misc instead. The group has the .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in,

here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

The rec.radio.amateur.misc, .packet, and .policy groups, and the rec.radio.info group, are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server. The rec.radio.swap group is not available for reading by electronic mail. At this writing, the most recently added groups are also not available for reading by

electronic mail, although that may change.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I would be happy to make it available via HAM-server.

I am under the impression that anything of interest to amateur radio packet
users can be uploaded (via ftp) to ucsd.edu in the /hamradio/packet/incoming
area. You should also leave a short txt file describing what you are uploading
so the sysop can put it in its proper place.

PACKET TECHCON

THEME
WORLDWIDE NETWORKING ON PACKET

1993 ARRL NATIONAL CONVENTION

Huntsville, Alabama
August 14-15, 1993

* 56k baud...What is it? What does it do for the user?
Coordinated by GRAPES: Doug Drye (KD4NC) and Bruce

Nebergall (K4TQL)

* What is networking? AX.25 vs IP routing...
  Coordinated by ALANET: Richard Elling (KB4HB)

* 9600 baud workshop...How you do it!
  Coordinated by the Gulf Coast 9600 Baud Group: David DeBlanc (WB5VMR), Angelo Glorioso (N5UXT), S. Felton Mitchell (WA4OSR), James Moore (WU3V), and Geoffrey Peacock (KD4GOE)

* User networking software...Where to get it...How to use it... Coordinated by ALANET: Jerry Pruett (KD4CIM)

* LINUX...An easy way to get into the UNIX environment...
  Coordinated by TENNET: Mark Bailey (N4XHX), Kelly Fulks (KC4RDJ), and David Wilson (WB5LHO)

* (Possibly more)

VENUE

All forums will be in the same room for two days. A 56k baud station and 9600 baud stations (5 different type of modems) will be available for demonstrations and for user interaction. Each forum will be one hour long. Then, there will be a one hour break for questions, demonstrations, user operations, etc.

>I'm going to need a power supply; but Ham Radio Outlet says their
>"least expensive" would be $109.

That;s about right for a new 12 volt 20 amp power supply.

>Is that ridiculous? (a real question) What should I expect to pay?
>Does anyone have a power supply that they would give/sell to me
>for a lot less?

Radio manufacturers tend to overrate the current requirements for their
radios. I.e. I have a Yeasu 290r (rated at 10a) running on an old
computer power supply rate at 4 amps at 12v. It works fine.

Since the 1200T is a 25 watt transmitter I would expect that an AT class
personal computer power supply (rated 4 amps at 12v continous)
would work fine for packet. Since these supplies can be picked up cheaply at
hamfests, compuer shows, junk bins, etc it's worth a shot.

Before you hook up any power supply to your radio, check it for voltage,
ac ripple and polarity before using. Also note that most 12 volt radios
really want 13.8 volts so they will run slighty under power at 12 volts.

How big would it be? if less than 50K I don't see a problem posting it here
as well, by all means post (or cross-post) it to an appropriate binaries group
in any case, this would automatically archive the software!

Hi,

I am interested in getting into packet radio, but haven't a clue where to start. I have a kenwood TH78a, and would like to use it to get into packet radio. What sort of tnc should one buy for a beginner? Also, I'd be interested in constructing one from a kit if someone has any suggestions.

Thanks in advance!

  For what computer? If you have a Macintosh, check out the PacketMac modem.
It's a nice little packet modem designed specifically for the Macintosh. It
is available from Sigma Design Associates. Unfortunately, that company is
currently moving, but if anyone is interested, I can give you more information.

I do not know about baud rate for thruput but I did do some tests over
the last few years on our system on this island. We found that using
two rose switches between users got you around forty characters per second
thruput when send 10k files to each other. Then we tried this going thru
the total system of rose switches on this island and found we had around
the same value. Interesting, no? Although there was an increase in the number
of switches used, the difference is that they change frequency from site
to site. Before we did that, we could barely make it thru the system.
Chris/AH6GG.

Can anyone tell me where I can obtain the alignment instructions
for a Clegg Mark 3? Now the radio is tuned to operate from 146
to 148 mhz and I want to tune it down so I can have it operating
on 145.01 mhz. Can anyone provide
me with the alignment instructions or perhaps a phone number
where I can get in contact with clegg devision if that company
still exists? I will gladly pay copying fees etc for the
instructions if anyone has them.
Thanks and 73, Doug

I know that KISS mode is most useful for someone who is using tcp/ip or
some other protocol.
I was just wondering, is it useful for those who have older tnc's and want
to use some of the latest features? In other words, a smart computer
program running the tnc which is set to dumb? Couldn't this allow older
tnc's to have the latest features? It doesn't seem that the actual
hardware protocol has changed since the tnc-1. Am I incorrect?

I'm looking to start working with packet radio, and I'd like some
recommendations on TNCs and/or multi-mode controllers. All I really have
to go on are advertisements.

I'd like to use it for HF and VHF, and will be doing some experimentation
with network gateways and with different protocols in the future. Meanwhile,
I'd like something that will work fine as a "black box" until I get time to
put together the code for the new protocols. Whatever hardware I get should
be usable with TCP/IP.

It looks like the MFJ 1270 is great; it seems to do everything and then some.
Yet the Kantronics KAM-Plus is about the same price, and doesn't do SSTV;
this makes me wonder about the price of the KAM-Plus _and_ the quality of the
1270. Then there's the stuff from AEA; I can't find any hard data about them,
as their ads aren't very informative. And I'm sure I'm missing a few.
What features should I look for?

A modem-only solution with all of the protocol being handled by the
computer would be fine as well, but I haven't seen any plain ol' modems
advertised.

Thanks for any advice,

Hank Oredson @ Mentor Graphics wrote a long flame about the fact that another
survey was being done by someone at ARRL. Let me answer his concerns from a
member's perspective:

I am a member within the New England Division (I gather from your email address
that you are not in New England). I feel that it is QUITE APPROPRIATE for a
division director to solicit input from that division's membership on ANY issue
on which that director needs input.

The Digital committee made recommendations to the Board of Directors, true. I am
pleased to hear that my division director ALSO wants to hear input directly from
the membership. Is there some problem with that?

Have you ever written a letter to Congress? Did you only send the letter via the
committee that was handling a particular issue? I'll bet that you sent copies
also to your own representative, the person who will cast YOUR vote on the issue.

This is how democracy works. Debate is GOOD for democracy. Gathering information
from as many sources as possible to ensure the most informed positions in a
debate is GOOD democracy in action.

Hi All,

 I hope I can get some help with this combo. I have been able to get G8BPQ
and FBB to talk with each other with no problems.. Been running for months
now. I am about to start to run JNOS here as a Gateway and I am having
problems. I am using G8BPQ 4.06F and FBB5.15 and JNOS 1.8C.

 Any help will be apperciated> Copies of one's AUTOEXEC.NOS file would be
helpful too!!!

I was just told that the verison the other fellow has
is not 1.50, so i'm not sure fithat site does or not have the lastest
version..

I guess the only was is to FTP and find out.

Hello!

Has anyone got an implmentation of KA9Q AX25 software running under NeXTSTEP?
If so I would like to have a copy...
Please reply by email,

Thanks!

If you like to build stuff, dont get a MFJ1278 or KAM. Get a
DRSI - PCPA 3 (note:3) card for the PC for like $150. It has two
rs232 ports for you to attach your own modems too. You can then build
your own modem. 9600 baud modems for instance, can be had in kit form
from TAPR (Tuscon Amateur Packet Radio) by mail for $70.

The card can handle 1-56000 baud. HF,VHF, satellite, its all "compatible"
but you have to build or buy the modems to hook up to it.

I use a FOSSIL driver for my Land Line BBS, but don't think any software
has been written to use it for Packet BBSing (yet that is). But maybe I'm
wrong. If ya find some...let me know. As that would be great for me also

Swami asks:

> The Sun Microsystems SPARC Station has and audio chip that
> has a sampling rate of 8 KHz. Can this be used to digitize then
> process a packet? Is the sampling rate high enough?

8 Khz is fast enough to process BEL-202 (standard VHF packet AFSK),
PSK for satellites/terrestrial, but NOT for 9600 bps direct FSK. All you
get is sampled audio which you must then demodulate using a software modem.
This must be followed by an HDLC decoder, again in software, AX.25, etc.,

all in software. It is achievable without a doubt, but a lot of work is
involved.

Bob

Dear all;

I would like to buy a TNC for connecting to a PC-AT compatible (286).
For the time-being, I would like to be able to operate
it using an ICOM 24AT handheld.
I have been told that handhelds do not support more than 2400 baud.
However, in future, I am planning to use such TNC as a gateway
running at higher speeds using an stationary radio.

I prefer to get a TNC, fully assembled, ready to use, and full featred.

Your recommendatios will be very much appreciated.

CAPRA - the Chicago Area Packet Radio Association has arranged to obtain a supply of Ian Wade, G3NRW's new TCP/IP primer - "NOSintro." Reviews of this book have been quite good.

This 356 page book is a hands-on tutorial with documentation regarding TCP/IP and NOS software version of this international standard as implemented for use with amateur packet radio operations.

An earlier posting listed all of the 35 chapters of the book which outline the basics and more advanced topics of TCP/IP; there are 6 Appendices with additional reference materials and information. The book has over 80 detailed diagrams with "countless examples of commands and screen displays".

The books will be shipped via U.S. Postal Service's 2nd Day Priority Mail service upon receipt here in suburban Chicago.

Ian Wade, the author, has given us a discount for our quantity purchase. The cost to you will be slightly under the total cost which you would have were ordering directly from the publisher in the U.K.

This is NOT a money making undertaking on the part of our group. Many of us are active on TCP/IP and feel that this is a way to increase the awareness of and technical expertise of others who may be interested in or who are currently using the protocol in amateur radio circles.

Send your complete mailing address, a telephone number at which you can be reached should there be a problem, and a check/money order made out to CAPRA in the amount of $22.50. Canadian hams should send $24.00 in the form of a Canada POST International Money Order payable in U.S. dollars.

8KHz is theoretically plenty, since it is easily fast enough to sample
a voice-grade telephone channel through which Bell 202 is supposed to work.

On a lark I coded the send side of a 300-baud modem for an older HP
workstation which has similar audio hardware. I called using cu via a
V.everything modem which connected just fine through the "acoustic coupler"
(headphones pressed against a telephone) and ran:

"ls -l | bell103 >/dev/audio"

I had forgotten how slow 300 baud is... Haven't done the Bell 103
receive side - that seems like some actual thought would be required :-)

I also had problems with using a 3c503. At the time I was having so many
hardware problems I was not prepared to blame the card or driver, but
after switching to an NE1000 my crashing problems have dissapeared.

CAPRA - the Chicago Area Packet Radio Association has printed John
Ackermanm, AG9V's -

"Getting Started with TCP/IP on Packet Radio."

We have copies of this 30 page user "guide" left over from our recent
TCP/IP seminar.

If you wish to obtain a copy, please send $3.00 to CAPRA as indicated
below. On your envelope - please mark, plainly, "AG9V Users Guide".

This is a non-profit offering, we will recover our costs for
duplication and mailing at the price shown.

Many of us are active on TCP/IP and feel that this is a way to
increase the awareness of and technical expertise of others who
may be interested in or who are currently using the protocol in
amateur radio circles.

Send your complete mailing address, a telephone number at which you
can be reached should there be a problem.

CAPRA - Chicago Area Packet Radio Association
Post Office Box 8251
Rolling Meadows, Illinois 60008

73 de Jim, N9GBH
CAPRA - Vice President

Orders will be taken until July 31, 1993.

Hello!

I am currently running ka9q nos, and it is working fine - however, I would
really like to be able to compile it so that I can make some changes, add
and remove some commands, etc.

So far, I have been unsuccessful at getting it to compile successfully,
using the files from the zip at ucsd.edu, ie when I do manage to get the
program to link, it hangs when executed. I don't even get to 'main'.

I have not made any changes to the source except for setting up the
makefile to my directory structure.

I tried ftping the rcs files, thinking they would be a more authoritative
version, but I was not able to check out from them - the RCS I got for the
PC had problems with certain files, and RCS on my unix box (NeXT) couldn't
read them at all (crlf problems maybe?).

Anyway, I really would like to compile the ka9q version because I want the
new dialer code and tcp/ip protocol optimizations he has made. But if I
can find a branch version that will compile cleanly, I'll try it!

Can anyone make recommendations as to which versions are the most
up-to-date, and how the different versions vary from ka9q?

Any compilation advice would be greatly appreciated.

Thanks!

I just uploaded AmiPac 6.3 to UCSD.EDU for all of you who have been
looking for it.

If you are an Amiga user and have been looking for a good shareware
packet terminal program, give it a try.

Enjoy!

I have an MFJ-1274 and an Alinco DR-1200. The TNC is _clearly_ causing
interference on the most popular packet frequency. Does anyone know what
I can adjust on the TNC to possibly fix this ?

I have it from a reliable source that there indeed IS a fossil driver
for radio modems. It's alleged to be availabe somewhere on Compu$erve
but I don't have any more info than that.

I think that there's a pot near the crystal that you can adjust to
move to interference somewhere else. Check the manual for the location
of the pot, or open up the tnc and see if there is something near the
crystal.

There is a FOSSIL for tnc's that was written about 2 years ago. I'm
trying to track the author down now. I'll post the responses plus the
file when I get more.

I am also almost finished with a driver that will talk TCP-IP, X.25
and a few other things on most any PC. Thing will be availabe soon,
and allow any BBS program (almost!) to play internet via SLIP.

Send email to get details when released.

Hi there,

    Thanks to all for replying re: using the HP100LX as the terminal/
node in my yet-to-be portable packet setup. My last question is causing me
some grief: what TNC to get? I'd like to get the max speed, which most
commonly seems to be 9600 bps, but is this impossible for a handheld
(Kenwood TH78A)? From what I've read, even 2400 bps seems "uncommon", but
I really don't want to go any lower than this. What TNCs are out there
that are 1)compact 2)battery-powered 3)2400 bps capable (modem built-in)
4)raise the dead (I figure if it can do all the other things I want...)
If I'm asking for a gizmo that violates the current laws of physics,
please set me straight, but if there IS such a do-it-all beast out there,
please TELL ME WHERE TO BUY IT!!!

Thanks^3,
       Tim

  Well, I haven't had much response from my other article on this subject,
in other groups... Maybe this is the best place for it...

  I'm looking for an MFJ1247 or an equivalent TNC. I'd like to be able to
use ka9q software with it, and I'd like to have HF and VHF capabilities. A
mailbox would be nice, too. This should all be standard equipment on the
MFJ, and I'm not an expert on other brands, so please let me know if I
should look for some other brand that might allow me additional features.
I'm looking to spend 60-80 dollars, depending on condition, and options.
New, these go for about $120, so I think 50% to 66% isn't a bad price for
used equipment. I'm somewhat flexible, so let me know. Also, if I've made
any errors in judgement (regarding standard features, prices, etc), please
correct me!

  Thanks in advance!

  - Patrick

I'm a "call-sign pending" tech plus who just passed the exams about three weeks ago. One of the first things I want to do when I get my ticket is get up and running on packet. I'm going to have a 2m handheld on loan for a while, but I need a TNC/multimode controller. I really have no idea what to get.

First, I wonder if I should get just a TNC or a full blown multimode controller? I know I'll be interested in packet, but what I don't know is whether or not I'll be interested in the other digital modes. About how much more could I expect to pay for a multimode than for just a TNC?

Another question is size. Living in fraternity/dorm rooms for the next two years will mean that whatever I get is better small. Eventually, I might even like to do a palmtop packet station, so that also puts a premium on size, and ideally, it should be capable of running on both batteries and AC or DC power. Although I know that most packet activity is still at 1200 baud, should I consider getting a 2400 baud TNC, or even a 9600 baud one?

Another concern is an external antenna. I can put a vertical on the roof of my fraternity house, but I may in the future be living in dormitory rooms as well, so I wouldn't mind advice on either a good outdoor antenna or an indoor antenna that can fit well in a dorm room.

I know that I'm asking a whole lot of questions, but I really would appreciate any advice on these issues. I'm really excited about getting on the air soon.

73,
_ken

p.s. one last request: does anyone know of a good mail order company(ies) I can get a free catalog from? The closest ham radio store to here is a 4 hour round trip.

Hello !

What is the TNC3 ?

Thanks for help

To: packet-radio@ucsd.edu

CAPRA - the Chicago Area Packet Radio Association has printed John
Ackermanm, AG9V's -

"Getting Started with TCP/IP on Packet Radio."

We have copies of this 30 page user "guide" left over from our recent
TCP/IP seminar.

If you wish to obtain a copy, please send $3.00 to CAPRA as indicated
below. On your envelope - please mark, plainly, "AG9V Users Guide".

This is a non-profit offering, we will recover our costs for
duplication and mailing at the price shown.

Many of us are active on TCP/IP and feel that this is a way to
increase the awareness of and technical expertise of others who
may be interested in or who are currently using the protocol in
amateur radio circles.

Send your complete mailing address, a telephone number at which you
can be reached should there be a problem.

Subject: CAPRA: NOSintro Book
To: packet-radio@ucsd.edu

CAPRA - the Chicago Area Packet Radio Association has arranged to obtain a supply of Ian Wade, G3NRW's new TCP/IP primer - "NOSintro." Reviews of this book have been quite good.

This 356 page book is a hands-on tutorial with documentation regarding TCP/IP and NOS software version of this international standard as implemented for use with amateur packet radio operations.

An earlier posting listed all of the 35 chapters of the book which outline the basics and more advanced topics of TCP/IP; there are 6 Appendices with additional reference materials and

information. The book has over 80 detailed diagrams with
"countless examples of commands and screen displays".

The books will be shipped via U.S. Postal Service's 2nd Day
Priority Mail service upon receipt here in suburban Chicago.

Ian Wade, the author, has given us a discount for our quantity
purchase. The cost to you will be slightly under the total cost which
you would have were ordering directly from the publisher in the U.K.

This is NOT a money making undertaking on the part of our group.
Many of us are active on TCP/IP and feel that this is a way to
increase the awareness of and technical expertise of others who
may be interested in or who are currently using the protocol in
amateur radio circles.

Send your complete mailing address, a telephone number at which
you can be reached should there be a problem, and a check/money
order made out to CAPRA in the amount of $22.50. Canadian hams
should send $24.00 in the form of a Canada POST International
Money Order payable in U.S. dollars.

To: packet-radio@ucsd.edu

If you like to build stuff, dont get a MFJ1278 or KAM. Get a
DRSI - PCPA 3 (note:3) card for the PC for like $150. It has two
rs232 ports for you to attach your own modems too. You can then build
your own modem. 9600 baud modems for instance, can be had in kit form
from TAPR (Tuscon Amateur Packet Radio) by mail for $70.

The card can handle 1-56000 baud. HF,VHF, satellite, its all "compatible"
but you have to build or buy the modems to hook up to it.

Subject: NOS versions and Compiling NOS
To: packet-radio@ucsd.edu

Hello!

I am currently running ka9q nos, and it is working fine - however, I would
really like to be able to compile it so that I can make some changes, add
and remove some commands, etc.

So far, I have been unsuccessful at getting it to compile successfully,
using the files from the zip at ucsd.edu, ie when I do manage to get the
program to link, it hangs when executed. I don't even get to 'main'.

I have not made any changes to the source except for setting up the
makefile to my directory structure.

I tried ftping the rcs files, thinking they would be a more authoritative

version, but I was not able to check out from them - the RCS I got for the PC had problems with certain files, and RCS on my unix box (NeXT) couldn't read them at all (crlf problems maybe?).

Anyway, I really would like to compile the ka9q version because I want the new dialer code and tcp/ip protocol optimizations he has made. But if I can find a branch version that will compile cleanly, I'll try it!

Can anyone make recommendations as to which versions are the most up-to-date, and how the different versions vary from ka9q?

Any compilation advice would be greatly appreciated.

Thanks!

I also had problems with using a 3c503. At the time I was having so many
hardware problems I was not prepared to blame the card or driver, but
after switching to an NE1000 my crashing problems have dissapeared.

Subject: TNC Recommendations
To: packet-radio@ucsd.edu

Dear all;

I would like to buy a TNC for connecting to a PC-AT compatible (286).
For the time-being, I would like to be able to operate
it using an ICOM 24AT handheld.
I have been told that handhelds do not support more than 2400 baud.
However, in future, I am planning to use such TNC as a gateway
running at higher speeds using an stationary radio.

I prefer to get a TNC, fully assembled, ready to use, and full featred.

Your recommendatios will be very much appreciated.

Regards,

Subject: Using Sun SPARC Audio Chip as TNC
To: packet-radio@ucsd.edu

Swami asks:

>   The Sun Microsystems SPARC Station has and audio chip that
>   has a sampling rate of 8 KHz. Can this be used to digitize then
>   process a packet? Is the sampling rate high enough?

8 Khz is fast enough to process BEL-202 (standard VHF packet AFSK),
PSK for satellites/terrestrial, but NOT for 9600 bps direct FSK. All you
get is sampled audio which you must then demodulate using a software modem.
This must be followed by an HDLC decoder, again in software, AX.25, etc.,
all in software. It is achievable without a doubt, but a lot of work is
involved.

:   process a packet? Is the sampling rate high enough?

8KHz is theoretically plenty, since it is easily fast enough to sample
a voice-grade telephone channel through which Bell 202 is supposed to work.

On a lark I coded the send side of a 300-baud modem for an older HP
workstation which has similar audio hardware. I called using cu via a
V.everything modem which connected just fine through the "acoustic coupler"
(headphones pressed against a telephone) and ran:

     "ls -l | bell103 >/dev/audio"

I had forgotten how slow 300 baud is... Haven't done the Bell 103
receive side - that seems like some actual thought would be required :-)

Subject: Packet newbie here...
To: packet-radio@ucsd.edu

     I'm a "call-sign pending" tech plus who just passed the exams about three weeks ago. One of the first things I want to do when I get my ticket is get up and running on packet. I'm going to have a 2m handheld on loan for a while, but I need a TNC/multimode controller. I really have no idea what to get.
     First, I wonder if I should get just a TNC or a full blown multimode controller? I know I'll be interested in packet, but what I don't know is whether or not I'll be interested in the other digital modes. About how much more could I expect to pay for a multimode than for just a TNC?
     Another question is size. Living in fraternity/dorm rooms for the next two years will mean that whatever I get is better small. Eventually, I might even like to do a palmtop packet station, so that also puts a premium on size, and ideally, it should be capable of running on both batteries and AC or DC power. Although I know that most packet activity is still at 1200 baud, should I consider getting a 2400 baud TNC, or even a 9600 baud one?
     Another concern is an external antenna. I can put a vertical on the roof of my fraternity house, but I may in the future be living in dormitory rooms as well, so I wouldn't mind advice on either a good outdoor antenna or an indoor antenna that can fit well in a dorm room.
     I know that I'm asking a whole lot of questions, but I really would appreciate any advice on these issues. I'm really excited about getting on the air soon.

73,
_ken

p.s. one last request: does anyone know of a good mail order company(ies) I can get a free catalog from? The closest ham radio store to here is a 4 hour round trip.

Subject: WANTED: MFJ1274 or equiv
To: packet-radio@ucsd.edu

  Well, I haven't had much response from my other article on this subject, in other groups... Maybe this is the best place for it...

  I'm looking for an MFJ1247 or an equivalent TNC. I'd like to be able to use ka9q software with it, and I'd like to have HF and VHF capabilities. A mailbox would be nice, too. This should all be standard equipment on the MFJ, and I'm not an expert on other brands, so please let me know if I should look for some other brand that might allow me additional features. I'm looking to spend 60-80 dollars, depending on condition, and options. New, these go for about $120, so I think 50% to 66% isn't a bad price for used equipment. I'm somewhat flexible, so let me know. Also, if I've made any errors in judgement (regarding standard features, prices, etc), please correct me!

  Thanks in advance!

  - Patrick

The MFJ1274 is a good choice for a TNC primarily used at VHF with some
limited HF operation. While the later standard firmware has a KISS mode,
most TCP/IP users replace that with the K3MC KISS_ONLY ROM image. That
gets rid of features like the mailbox (only available with the latest
firmware anyway, beware of used purchases in this regard) which is
redundant with TCP/IP. If you're primarily interested in HF operation,
the MFJ1274 is a less good choice. Then you should be looking at
multimode units like the PK232 and KAM which have superior HF filters.
Note that these are less than stellar performers with TCP/IP, however,
since you're stuck with their proprietary firmware which has arbitrary
limits on packet size. Also, adding higher speed modems is difficult
to impossible with these proprietary boxes. Since the MFJ is a true
TAPR clone, addition of high speed modems is straight forward.

Gary

check out this months issues of CQ and QST. one of these (can't find mine
right now) has an article on a portable 2-meter antenna using pvc and some
wire. seems pretty lowcost, portable (hang out the window whey you want to
use it) and a good first project if you are into that. one word of caution
about this though...check and see what the interference is from the tnc that
you get. i have an mfj 1270b and it is so noisy that the only way i could
get a reliable connection to the bbs was to put the antenna on the roof.
also, make sure that the system is grounded for the rf stuff.

welome to ham radio. enjoy whatever niches you find and don't be afraid to
at least give other areas a try. you just might like it.

Multimodes command about a 3X premium over TAPR clones. It's not worth
it unless you intend to operate a lot of HF, which, of course, also
demands a HF rig and antennas.

PacComm has the Micropower TNC which is all CMOS, and still TAPR
compatible. It's power requirements let you operate battery portable.
There are also smaller TNCs like the Handipacket, but they are based
on proprietary designs and aftermarket firmware and hardware aren't
available. You should plan on eventually going to a higher speed modem,
but that's very location dependent. Find out what's current in your area.
It does no good to have a 9600 baud modem and find no one to converse with.
Having a TNC that's TAPR TNC2 compatible is very useful because it means
that changing to a higher speed modem is a drop in operation via the
modem disconnect header. Not all TNCs have this. Also 9600 baud will
likely require radio modifications, and not all radios are easily
modified. 2400 baud shouldn't have this problem, but the throughput
improvement is not nearly as much as you'd expect due to the half
duplex nature of packet with it's fairly long turnaround times.
Unless it's a local favorite, I'd say don't bother with 2400 baud.

>   Another concern is an external antenna. I can put a vertical on

The best external antennas price/performance wise are the Comet and
Diamond lines. Avoid the Cushcraft Ringos unless someone *pays* you
to take it. :-)

For indoor antennas and HTs, the AEA Hotrod is good, but you'll find
that HTs and packet don't mix that well unless you use a remote
antenna. Usually a mobile magmount stuck on a filing cabinet will be
fine. The problem is RF feedback into the TNC, and TNC hash getting
into the HT. A separate antenna should be considered a must have option.

>p.s. one last request: does anyone know of a good mail order
>company(ies) I can get a free catalog from? The closest ham radio
>store to here is a 4 hour round trip.

Amateur Electronic Supply, get on their mailing list. You'll find
their ad in any QST. HRO and a few others also offer catalogs, but
QST is *itself* a catalog, so if you subscribe, you don't really
need any of the others.

Macintosh Amateur Radio Software - June 1993

The information in this list was gleaned mostly from flyers supplied by the
software vendors, or in some cases from reviews in amateur radio publications
or the README files included with the archive. Some of the information has
not been verified for a long time; please check with the vendors/authors for
the latest product specs, pricing, etc.

NEW/CHANGES: This latest list contains info on KC1SP's latest test stack

updates for the new questions for Novice and Technician (just a reminder, effective 1 July 1993), MorseTrainer US-1.0.1b20, Savant 1.0 DEMO, Marathon, IM/Mac 1.0b27m, NET/Mac 2.3.22, Mac MiniMuf and even more information on ftp'able sites carrying Amateur Radio software. Several new items were added at the last moment, more information to follow. Additional e-mail addresses for various authors. New ftp'able site sponsored by the Boston Amateur Radio Club on The World (world.std.com) for both Mac and Apple //. Is ZCo Corporation out of business???

--Collections--

MacNet

Public-domain programs (currently on 12 disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television. Send formatted 800K Macintosh disks with stamped, self-addressed disk mailer to John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103. Contributions of public-domain programs are encouraged.

Project Mac

Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection.

Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, 75 Kreger Drive, Wolcott, CT 06716. (Compuserve: 70645,247)

Amateur Radio Software for Macintosh

Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.

ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

Amateur Radio #1

Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs.

Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

--Test preparation--

Ham Test Stacks

HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests.

The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions eff. 7/1/93), General v2.4, Advanced v2.4, Extra v2.4

If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, she takes no responsibility for the condition of the diskette through US mail.

Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu

(/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com

MacHam
 Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license.
 Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.

--Morse code practice--
N6MZV Morse Trainer
 Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
 RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Shareware.

Morse Tutor
 Sends random groups of letters, numbers, and/or punctuation characters.
 Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

Morse Mania
 Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware.
 Available via anonymous FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

MacMorse
 Randomly sends chosen characters. Lets you create your own practice files.
 David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

MacMorse v1.3
 MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware.
 Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

MacSamuel
 Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns.
 Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

Zihua Morse
 Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the

program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check.
 Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

Sparks-II(f)
 More Code training program.
 Available for anonymous ftp at rahul.net /pub/davidj/radio

Morse Master 1.0
 The newest of the morse code training programs. Looks great - 3/30/93
 The author can be reached thru the following e-mail addresses: nitasaka@mcz.harvard.edu (internet) or enitasak@ddbj.nig.ac.jp (internet). (Her AOL account is no longer valid - moved back to Japan after her studies.)

MorseTrainer US-1.0.1b20
 MorseTrainer is a powerful tool for learning and training Morse code. This is the first translated version of the program which originally was developed and localized for Sweden. The program itself can be considered a final version of v1.0.1 but the translation is probably not perfect, hence a beta-release instead of final-release.
 Features: three different training modes: user text, random text, library text; arbitrary signal pitch and timbre; arbitrary speed and tempo; multi-alphabet support; random text generator, text library editor; on-line alphabet; on-line manual; Help Balloons; and a lot more! FREEWARE!
 MorseTrainer will soon be available on a number of different archives such as sumex-aim.stanford.edu and all its shadow-copies. A swedish version (S-1.0.1) is available via anonymous ftp using the address 130.235.20.3 in the mac/swedish/ directory.

--Packet and other digital modes--
NET/Mac 3.2.22
 Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use.
 Available via anonymous FTP from ftp.apple.com (/pub/ham-radio); and on the Digikron Systems, WB3FFV, and N8EMR dialup BBSs. Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129.
 Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the modifications to NET/Mac. This version (and others) is available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/pa2aga).

Domain-to-Hosts Converter
 This application will create a hosts.net file from the domain.txt file that PC owners use with NOS. Created by Ken-NS1N is available on many TCP/IP packet switches in New England.program. Version 1.0r3 is the latest release.

IM/Mac 1.0b27(x)
 Mailer program for use with the SMTP protocol. Alternative to the BM program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly updating his mailer program. Check for the latest release in the directory

before "blind" ftp'ing. (Latest release as of 5/26/93 is 1.0b27k)
 Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/pa2aga).

SoftKiss 1.6
 Control panel device that emulates a TNC running in KISS mode. For use with packet-radio modems such as the Baycom kit and PacketMac Modem. Available on the HAMNET forum of Compuserve, America Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).

Virtuoso 1.4
 Terminal program that works with TNCs to display packet, RTTY, AMTOR, and CW. Features a split screen and a type-ahead buffer. Includes a word search utility, a spelling checker, and a built-in scripting language for automating routine tasks. Shareware.
 Available on America Online, GEnie, and Compuserve. Also available via anonymous FTP from ucsd.edu (/hamradio/packet/misc), cpre1.ee.iastate.edu (pub/ke0ph - author's directory) and other sites.
 Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to James E. Van Peursem,
 KE0PH, 4140 Jay Avenue, Orange City, IA 51041; Internet:jvp@iastate.edu.

Savant 1.0
 A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC, unlike MacRatt or HostMaster.
 A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to KE0PH, 4140 Jay Avenue, Orange City, IA 51041.

MacRatt with FAX
 Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable.
 Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

HostMaster
 no info yet (hint, hint)

--RTTY--
MacTTY
 Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages.
 Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

WeFaxWorks
 Weather facsimile terminal program for use with Kantronics TNCs.
 Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

--Logging--
Ham Radio Station Logbook
 HyperCard stack that stores and displays radio contact information.

Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help.
 SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

FDLog!
 Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates.
 System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

MacContest 3.5
 Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes, figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry.
 Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

LOGic
 (Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs.
 Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

HF Logger 1.2
 A real fine HyperCard logging program! (hey... thats all I got!)
 N0QGQ

Simple Log .2b
 This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA
 Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103

Marathon
 Contesting/logging- Have seen references to (March92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

--Propagation, gray line, DX headings--
DX Map
 Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware.

Requires HyperCard 2.0.
 Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

SatTrak
 Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware.
 Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

Sun Clock
 Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location.
 MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

DX Window
 Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings.
 Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.1
 Enter solar flux and get propagation predictions to desired areas of the world.
 Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.5
 Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information.
 Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

DX Helper
 Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice.
 MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

Mac MiniMUF
 A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer).
 His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

--Satellite tracking--
SatTrak
 Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all

satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware.
 Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

MacSat
 Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon.
 Developed by the Geodetic Research Laboratory of the University of New Brunswick.
 Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada.

OrbiTrack
 Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program).
 BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

QuikMac
 Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

Satellite Orbit Prediction Program
 Macintosh conversion of W3IWI program. Requires Microsoft BASIC.
 Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

Satellite Pro
 Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control.
 MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

--Antenna design--
MacMiniNEC
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

--Radio control--
ICOM Radio Control
 Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and

modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

FreqValet
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax).

--Misc--
Macnet Roster HC Stack v356
This is a HyperCard stack that relates all of the hams known that use Macintosh computers. Contact WD1V for more info

--Ham radio BBSs--
Digikron Systems BBS
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

MacScience BBS
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

N8EMR BBS
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

ChowdaNet BBS
(more info at a later date)

--Online Services carrying Ham Radio software--
America Online/PC-Link/Promonade
Supports Macintosh, PC's DOS/Windows, PS/1, Apple //s. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364

Ext. 6285. This site NOT ftb'able(yet). Internet e-mail.

CompuServe
 Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats. Call 1-800-848-8199 for information. This site NOT ftb'able. Internet e-mail.

Delphi
 (more info at a later date)

GEnie
 (more info at a later date)

Prodigy
 Has ham radio message areas, no downloadable software.

>>(my news reader can't quote)

In any high speed amateur network you will sooner or later run into digital audio files. The whole idea that these files may or may not be legal to transmit because of musical content is a little bit absurd. But in ATV applications this is a really
serious problem for people who want to play there own original video productions over the air. All kinds of neat digital multi media things are being done these days.
But practically speaking multi-media is banned from amateur radio. I haven't read the complete part 97 rules but I always thought that one of radios functions was to
'broadcast' to more than one person.

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: ----------

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

Ok guys, Ihave my TNC (KAM PLUS), my computer mac Quadra,
and some of the TCP/IP software.

My question is I have a 2meter radio but dont know where
to find a link station in my area (hartford, CT).

Anyone know who to contact? - also where do I get my domain from.

thanks in adavance.

Hi. I would like to know what is happening with the internet to packet
systems. I can still get to wa4ong.handheld.com where I can telnet to the
system in Hawaii. However, I was registered on ke9yq and this system is no
longer reachable at ke9yq.imsa.edu. I need this because I need to be able
to packet into St. Louis, MO and into Illinois.
If anyone can shed some light on this I'd be greatful. 73 de nu7i

I'm trying to connect my Alinco DJ-580 to an AEA PK-232MBX controller -- I
bought an MFJ-5024 connector to plug into the Alinco. This is the cable
schematic:

So far, I've figured-out that 'red' coming from the DJ-580 is the Rec Audio
-- I can receive packets. But, I can't get the transmit working... Does
anyone have a clue?...

this is cute (grin) I need to setup the software and no idea what most of
commands mean. Even after reading the docs. I usually use example configs
and work from that. Can't seem to find any of those either (grin)

any suggestions?

Hi,

We are trying to setup a gateway between Ethernet IP and radio IP at our
site. The radio side is working fine, but the ethernet does not. We are using
an Etherlink II board from 3Com and the corresponding 3C503.COM packet driver.
I've double checked interrupt and memory collisions and the board configuration
but when I start the driver it will crash the PC so that even CAD (Ctrl-Alt-Del)
will no longer work. I've tryed several cards and several machines whith the

same result (All cards where Etherlink II cards, the PCs where 286 and 386).

The crash seems to come after one or several packets have been detected by the card, since the driver will not crash when the ethernet cable (Thin ethernet BTW) is not connected. I've tried several I/O ports and IRQ and even several packet INTs (0x79 and 0x62)) with the same result.

Note that no software needs to be started (network or other) for the crash to occur.

Any ideas, hints or solutions ?

Thank you very much

Gast Gloesener

    I'm using the Danish packet program PTM522 and I'm having a small problem
with the mail snatcher. I can get the program to connect to our local node
(DCA) but can't get it to connect to my home BBS (BWIBBS) from there. If I make
the connection myself, mail transferes as it should but if I let it do it
on it's own, it stops at the node. My setup reads   DCA4,C BWIBBS   and I
suspect it's waiting for something from the node and not getting it. All the
node says after connecting is ***Connected to DCA4. Any ideas?

    Second problem. I can't seem to get a registration number for the program
out of the Stateside point of registration.

Thanks in advance and good luck on FD Saturday!

At a hamfest this weekend I purchased a PK-232MBX.
However, It did not come with the main user manual
(just upgrade installation insructions).

It appears to be stuck in FAX mode.

Symptoms: When connected to the computer, All I get is a continuous stream
of characters. When it is also connected to a HF Rig tunned to a WEFAX frequency
the characters change.

Can anyone provide me with information on how to get it doing VHF packet?

A pinout of the back connectors would be nice to!

Important info:

Model # PK-232MBX
Serial # 55820
Firmware Date 01.AUG.91
ID number on Rom's E1742

I'm going to contact AEA ASAP to see about ordering a manual.

Thanks,

Neil Johnson

>Interesting... I didn't know they had Bell-202 modes? Has anyone done
>this? I see a few requirements:

Older hayes were able to generate RTTY tone but not "packet" tones.
Even if you have a way to generate and detect bell 202 tones you
still have some work to build the actual packets to be sent out.
The TNC has several parts.

PTT, You need something that can switch between
transmit and receive.

Modem this is what generates the outgoing tones,
It also dectects the incommming tones. Note
at higher speeds you may or may not hear a tone.

PAD, Packet assembler,disassembler. This is what
takes the characters you type and turns it into an
AX25 packet. (this is were most of the TNC computer
power goes)

User interface. THis is the CMD: prompt. It allows
the user to set various PAD,modem and PTT options.

Well, the problem is that if I get new mail the STA light should blink and
is not. I am using PC-Packratt 88 with it. I think it is just a software
setting, but I can't find it. Any help would be greatly appreciated.

Thanks and 73's - KA0ZRW - Tech. - Chris

news.intercon.com!psinntp!arrl.org
From: lhurder@arrl.org (Luck Hurder KY1T)
Newsgroups: rec.radio.amateur.packet
Subject: ARRL Questionnaire (N.E. Division)
Message-ID: <1625@arrl.org>
Date: 21 Jun 93 12:06:02 EDT
Organization: American Radio Relay League
Lines: 125

For those of you in the New England ARRL Division, your elected
ARRL Director would like to hear from you with regard to the
following.   Please feel free to respond to ME, if you wish,
via Email on this network, at which point I can easily forward
your response to your Director.

Luck Hurder, KY1T
ARRL HQ Newington CT

              June 18, 1993

              QUESTIONAIRE

             NEW ENGLAND DIVISION

     Please answer the following questions and return before July 5 to:

              Bill Burden, WB1BRE
                   RR1 Box 157
              Strafford, VT 05072

     This will allow us to analyze the results and review it prior
          to the Director's meeting on July 16, 17.

PART A. AUTOMATIC AND SEMI-AUTOMATIC HF DIGITAL CONCERNS:

(If you are purely a VHF/UHF operator, or above; or a phone operator at HF, please don't respond to this portion of the questionaire. HF here is defined as the Amateur bands below 30 Mhz. VHF includes the 6M band on up to 225 Mhz. UHF includes the 420 Mhz and 902 Mhz bands. Microwave frequencies are the Amateur bands from 1240 Mhz up.)

1. Do you use HF Digital (Packet, Pactor, Clover, RTTY or other, not CW) modes?
Yes _____ No _____. If Yes or plan to: Rarely _____, 1-5 times

per month _____, Daily _____.

2. Do you, or do you plan to use Automatic HF Digital Forwarding? (This is sending and receiving digital messages on specifically designated HF bands at times no operator is actually in control during sending and receiving. This activity was permitted under FCC Special Temporary Authorization)

Yes ____, No ____. If Yes, Rarely _____, 1-5 times per month ____

Daily _____.

3. The ARRL Board of Directors is considering proposals to permit SEMI-AUTOMATIC, HF DIGITAL FORWARDING. (This is sending and receiving digital messages on HF bands at times when one control operator is on frequency. A directed message is recorded in a BBS for later transmission, or a message from a non-attended BBS is collected and received later. This activity would not take place in real time. This activity is not currently permitted by the FCC on HF Amateur bands). Do you believe you would use this mode?

Yes ____, No ____. If Yes, Rarely _____, 1-5 times per month _____

Daily _____.

4. Do you operate CW on HF Frequencies? Yes ____, No _____.

If Yes, Rarely _____, 1-5 times per month _____, Daily ______.

PART B. SPECTRUM MANAGEMENT, USE OF SPECTRUM, AND BANDPLANNING.

5. Do you believe it is desirable to retain a significant portion

of HF Amateur bands reserved exclusively for CW communications?

Yes _____, No _____.

6. Do you believe the UHF, VHF, and HF bands should be sectioned off to provide exculsive portions to such modes as ATV, SSTV, Beacons, weak signal ops, digital (with consideration of protocol baud rate, control operator functions, etc)?

Yes _____, No _____.

For the record I don't want to come out against experimentation. I
feel it is absurd to use a sound board on a PC for 1200 baud packet.
If you want to write software for this or experiment with new modes
then go for it. It sounds like a great project for learning.

There is a *big* difference between software which is released free for
non-commercial, Amateur Radio use and "public domain".

I'm not sure if Packet Tracker has been uploaded to ftp sites yet... We
plan to get all RATS software (ROSE Switch, ROSErrver/PRMBS PBBS, RMAILer,
STS, PackeTracker, etc.) available hereon the net.

For PackeTracker-specific questions, please send email to Mark Sproul,
KB2ICI: sproul@sproul.com

Clay, if the DJ-580 is an HT you probably will need to put together a
small circuit (either a resistor and capacitor, or a transformer) as PTT
is handled by a DC circuit on the TX audio line.

(Let me know if you need more help -- send me mail)

The ARRL survey in question 3 seems to force a 2-way choice when there may
be additional possible responses. An alternative is to follow our
neighbors to the North and allow operations anywhere authorized by
the class of license - provided emissions remain within the band edges.
This has not led to anarchy in Canada - and it probably won't here
either.

Surveys like the ARRL survey I reference (released by Luck Hurder of

ARRL for the NE Director) often lead individuals into making narrow
choices amongst the choice the author would prefer. It is hard to
create an impartial, unbiased survey. One can only hope the ARRL
Board will be smart enough to recognize this and add some common-sense
to their interpretation. Otherwise we will have a reoccurrence of the
now famous QST/RTTY Journal survey that received only around 550
responses (from a combined readership of ofver 200,00 if I recall
correctly) and was used by the ARRL as evidence supporting their
initial proposal. Surveys can be dangerous things .....

Thanks for the replies.

I called AEA and ordered a set of manuals (about $35 including
overnight shipping).

The service rep was VERY helpful. Based on my description of the
problem he knew right a way what the problem was.

Basically the Wall transformer I was using didn't supply enough
current for the unit to operate properly. I've since gotten a
bigger wall pack and every thing works fine.

Thanks to all of you who responded.

I was very impressed with AEA. I will definitely consider them
when purchasing ham equipment in the future.

I have a cousin who has an AMIGA in Northern Ireland. First off, are licenses
to operate packet difficult in Britain? Second, what kind of TNC, or software
is needed for an AMIGA 500? Would a KANTRONICS work?

Well folks - I thought the ARRL had a digital committee tasked with
investigating these issues, had already done a survey, and had hosted
a meeting to discuss the serious issues raised by the ARRL's position.
Yes - this all did happen - but the folks at the ARRL in charge of
making decisions appear to have decided to ignore what the digital
committe recommended. So, as an Ronnie Reagan used to say "There
you go again ..."

To the folks at the ARRL:

Please publish some real data here before you start in again
with these "surveys".

1. Text of existing NPRMs.
2. ARRL responses (or other filings) about these NPRMs.
3. Minutes of the Dallas neeting, including the instructions to
    the digital committee.
4. Communications from the FCC, or influential FCC personal, relating
    to these matters.

In article <1625@arrl.org>, lhurder@arrl.org (Luck Hurder KY1T) writes:
|>
|> For those of you in the New England ARRL Division, your elected
|> ARRL Director would like to hear from you with regard to the
|> following.   Please feel free to respond to ME, if you wish,
|> via Email on this network, at which point I can easily forward
|> your response to your Director.
|>
|> Luck Hurder, KY1T
|> ARRL HQ Newington CT
|>
|>   June 18, 1993
|>
|>   QUESTIONAIRE
|>
|>   NEW ENGLAND DIVISION
|>
|>   Please answer the following questions and return before July 5 to:
|>
|>   Bill Burden, WB1BRE
|>   RR1 Box 157
|>   Strafford, VT 05072
|>
|>   This will allow us to analyze the results and review it prior
|>   to the Director's meeting on July 16, 17.
|>
|> PART A. AUTOMATIC AND SEMI-AUTOMATIC HF DIGITAL CONCERNS:
|>
|>   (If you are purely a VHF/UHF operator, or above; or a phone
|>   operator at HF, please don't respond to this portion of the
|>   questionaire. HF here is defined as the Amateur bands below
|>   30 Mhz. VHF includes the 6M band on up to 225 Mhz. UHF
|>   includes the 420 Mhz and 902 Mhz bands. Microwave frequencies
|>   are the Amateur bands from 1240 Mhz up.)
|>
|>   1. Do you use HF Digital (Packet, Pactor, Clover, RTTY or other,
|>   not CW) modes?
|>   Yes ______ No _____. If Yes or plan to: Rarely _____, 1-5 times
|>
|>   per month _____, Daily _____.

Since almost all long haul bbs forwarding traffic is moved via HF,
most " ... purely a VHF/UHF operator ..." type folks also make use of
the existing HF networks. Rewording the question to ask if you "make use
of HF or of the services provided by the existing HF network" might better

capture the actual use of the existing facilities.

|>
|> 2. Do you, or do you plan to use Automatic HF Digital Forwarding?
|> (This is sending and receiving digital messages on specifically
|> designated HF bands at times no operator is actually in control
|> during sending and receiving. This activity was permitted under
|> FCC Special Temporary Authorization)
|>
|> Yes ____, No ____. If Yes, Rarely _____, 1-5 times per month ____
|>
|> Daily _____.
|>

Or "do you now or do you plan to send ANY long distance message, or send or read any bulletins which require large geographic coverage".

|> 3. The ARRL Board of Directors is considering proposals to permit
|> SEMI-AUTOMATIC, HF DIGITAL FORWARDING. (This is sending and
|> receiving digital messages on HF bands at times when one control
|> operator is on frequency. A directed message is recorded in a
|> BBS for later transmission, or a message from a non-attended BBS
|> is collected and received later. This activity would not take
|> place in real time. This activity is not currently permitted by
|> the FCC on HF Amateur bands). Do you believe you would use this
|> mode?
|>
|> Yes ____, No ____. If Yes, Rarely _____, 1-5 times per month _____
|>
|> Daily _____.
|>
|> 4. Do you operate CW on HF Frequencies? Yes ____, No _____.
|>
|> If Yes, Rarely _____, 1-5 times per month _____, Daily ______.
|>

The FCC is also considering such a proposal ... and the ARRL has been "considering" this proposal for about eight years now, without any useful action taking place. My personal assumption is that the ARRL will continue to "consider" and will fail to take any useful action.

"SEMI-AUTOMATIC" is the ARRL's new "joke" mode ...
"Well, let's see here ... yup, I'm here, so I'm a control op for my station.
 Nobody home at the other station? Probably not. Must be "SEMI-AUTOMATIC" then". Or is it simply a control link with a single operator controlling both stations? What is a "directed message"? For that matter, what is a "non-directed message"? How does the "SEMI-AUTOMATIC" station differ from a fully automatic station? What about nodes, digipeaters, network routers?

Let's get some discussion going here ...

|>
|>

|>
|>
|>
|>
|>
|>
|> PART B. SPECTRUM MANAGEMENT, USE OF SPECTRUM, AND BANDPLANNING.
|>
|> 5. Do you believe it is desirable to retain a significant portion
|> of HF Amateur bands reserved exclusively for CW communications?
|>
|> Yes _____, No _____.

"Significant"? What would that be? 10Khz on 20M? 100 Khz?

|>
|> 6. Do you believe the UHF, VHF, and HF bands should be sectioned
|> off to provide exculsive portions to such modes as ATV, SSTV,
|> Beacons, weak signal ops, digital (with consideration of protocol
|> baud rate, control operator functions, etc)?

"sectioned off"? Does this mean by gentlemans agreement type band plans?
Does it mean by FCC action? Do we want the bands divided up into mode-specific
slivers for modes that differ (for example) by baud rate? "Sorry, this is the
45.45 baud RTTY band, you need to QSY to the 50 buad RTTY band."

|>
|> Yes _____, No _____.

Well, it is most certainly true that music may not be transmitted over the
air on amateur radio. However, that doesn't necessarily mean that
multimedia is banned.
You should be able to transfer voice and any relevant sounds over the air
as long as they do not contain music. I would think a video production
thing may be possible minus the music and as long as it is made clear that
the broadcase is experimental. Of course, you might come into conflict
with the no broadcasting rule but this is not a problem if it is relatively
short and obviously part of an experimental net of some sort where other
amateurs are listening and transmitting similar information and images.

I used to operate packet in N. Ireland with an Amiga. You don't
need a special license unless you want to set up a bulletin board or
similar system. Most packet operation in the Belfast area is on
2m (144.625 /.650 /.675 MHz) or 70cm, so a Class B license (VHF only)
is fine.

I used a kit-built TNC-2 clone, but any of the standard ones will work
fine, the standards are the same worldwide.

If your cousin listens around the repeaters he should be able to find the
names of some of the packet station operators, I can't remember details,
sorry.

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: ----------

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

Frequently Asked Questions for Amateur Packet Radio

Version 1.15 - Last modified 6/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

It's pledge month(s?) for the rec.radio.digital.misc FAQ. With the creation of this new newsgroup, I will be needing some input to add coverage for the other digital modes, i.e. RTTY, AMTOR, PacTOR, CLOVER, digital voice, and so forth. If you have information on any of these areas that you think would be helpful to other hams, please send it to digital-faq@Wattres.SJ.CA.US.

Thanks, and back to your regularly scheduled program.
****

The Packet Radio FAQ list will be posted on a monthly basis to rec.radio.amateur.packet and rec.radio.amateur.digital.misc. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy

of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems.

See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your

boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

telnet knuth.mtsu.edu 372

or

telnet 161.45.1.1 372

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites and electronic mail servers are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also,

general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is
easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains
current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.
(I have one report (from George Hitz, W1DA) that this FTP site will be
down until the end of this summer, 1993. Reportedly the site admin is
going to be in Sweden.)

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using
a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features
like scrolling or saving the windows, but the individual sessions can be
recorded into a file.

As for mail servers, there is only one that I know of at the moment:

Ham-Server@GRAFex.Cupertino.CA.US

This mail server has a wide variety of information on most aspects of
amateur radio, not just packet. Send a message with the body HELP to
get a fairly useful listing.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is
probably info@arrl.org. That is where general information about the
ARRL can be acquired. This address reaches a person, so you'll have
to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateways

There are currently two comprehensive gateways between the Internet and the packet radio BBS system. One is run by Jim Durham, W2XO, in Pennysylvania and the other, which allows access to PBBS bulletins, as well as mail, is run by Bob Arasmith, N0ARY, in California.

2.4.1 The W2XO Gateway

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

2.4.2 The N0ARY Internet mail <-> full packet BBS gateway

Bob Arasmith, N0ARY, runs a gateway between the Internet mail system and PBBS system. His gateway allows you to read, post, and respond to other postings on the PBBS system via email. For more information, send mail to gateway_info@arasmith.com.

2.4.3 LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

TCP/IP doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol (called IP) on top of AX.25. This is used to increase efficiency of its transmissions, since IP does not require packets to be "reliable", that is to say, guaranteed delivered error-free. TCP handles the retransmission of lost and garbled packets in its own way, at a higher level. Therefore the extra information in an AX.25 "VC" (virtual circuit) frame is not useful, and thus consuming needed bandwidth.

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue

commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

What do people use as a good packet program for DOS/Windows? I currently have a KPC-3 and use the small pacterm program that came with it. It _works_, however I would like a more complex, and more 'aesteticly (sp) pleasing' program. I have tried a program called Graphic Windows, but it is in German, so I am at a loss (CW is hard enough :)).

Any suggestions?

Thanks and 73s,

I am looking into getting into packet on VHF and the various
digital modes on HF, and I have a couple of questions about
this:

1) Does anyone have a design for a simple, cheap, small, bare-
   bones TNC I can build for use with an HT or Mobile VHF radio?

2) Can anyone comment on the MFJ 1278B vs the Kam+ Multimode
   controllers? I have heard that the Kam+ is better, although
   a little more expensive. Any comments??

Thanks in advance,

Any TAPR TNC2 clone can be made KISS only by replacing the image in
the ROM with the K3MC ROM image. That includes the MFJ1270 and 1274,
the PacComm Tiny 2, and others. The Kantronics units use a different
processor so the code won't work. The AEA units use different SIO
chips and won't work either. Intel hex formatted images of the K3MC
KISS code are available from UCSD.

Does anyone know where the ARES16.EXE file might be ftp'd from? I have looked
at UCSD.EDU and have not been able to find it in the few logical (well, I
thought they were) sub-directories.

I am looking at this application as one to possibly use for our ARES/RACES
packet station for the maximum dispersion of information to as many of our
communities as possible.

Also wonder if anyone has done anything with the "broadcast" modes of packet
or fax? When I say "broadcast-mode" I mean being able to sent to many users
simultaneously with little if any handshaking. Say we had an alert message
and had to get that message to 80+ users instantly... how would you approach
it?

Any thoughts, suggestions or xxxxx please reply via e-mail. I would more than
happy to share with the net your replies.

It may also be worth mentioning that TAPR also has a kiss rom available
for tnc-1 clones like the AEA-1. The old tnc boxes can go for $50 or less
at ham fests.

Can't help with a modulator, but you could investigate the NICAM stereo
chips sets for a demodulator.

NICAM is used in the UK to give high-quality stereo sound on TV - it uses
a 6.552 MHz subcarrier and runs at abt 768kbit/s. The demod chip appears
to be a TA8662, which I think is a Toshiba part.

I've noted previous references to using the HP95 as a
packet controller connected to a tnc.

Anyone able to give me pointers to more information
about HP95 or HP100 capabilities/pitfalls and so on
for this application? (Pointers to sources of software
would be nice, too.)

It's OK, I'm just thinking about it so far...

Does anyone have a copy of the help file for the package in English. I have the Greman version but all documentation is in German, so understanding it is a bit tricky. I have just attempted to upgrade from version 1.2, so there are many differences.

73 Mike

I have a Kantronics KPC-4 Dual Port TNC for sale. It has the latest
firmware. This is a FULL dual port unit, great for making a gateway.

It is in the box with all the manuals.

Please make an offer. The new prices at AES is $269.

73 and thanks in advace!

>

Tom,

Yes, there is an excellent source for orbital "two line elements" via anonymous
FTP at 129.92.1.66

They are under the directory Pub/Space. the file amateur.tle
is for the amateur radio satellites. The file visual.tle is for satellites
that are "visible" with the naked eye and the file tle.new is for all satellites
visible or not. Also whenever there is a shuttle on orbit there will be
elements posted for it! Look for sts-57.tle this week!

These elements appear to be updated every two days!

GOOD LUCK

Randy WB8ZAL

Yep... I agree... I was just TOO bisy to find what you needed:

Here is my autoexec.nos file: (your mileage may differ but it is a start!)

```
#  A U T O E X E C . N O S
isat no
multitask no

mbox nrid on
#-------------------------------------------------
atte off
motd "Daneel <> Jack's TCP/IP Host"
smtp batch yes
smtp usemx on
smtp timer 600
#<endfile>
```

Some assumptions were made:

1. your machine is also on an ethernet and you have loaded a packet driver.
   If this is false. put a # in front of the lines that talk about "eth0"

2. You have domain service available.... if not you write a file with the
   local ampr.org users in it called "domain.txt" that looks like
   ```
   # DOMAIN.TXT
   w1aaa.ampr.org       IN      A       44.XXX.YYY.ZZZ
   ```

```
   w2bbb.ampr.org       IN      A       44.AAA.BBB.CCC
   (etc, etc......)

This file helps you figure out what your friends IP addresses are..

3. You have a local router. If you dont... you should not be considering
   TCP/IP!....
   the line:
   route add default sl0 [129.111.1.13] # ethernet router
   should look like:
   route add default ax0 [44.AAA.BBB.CCC] # AX.25 router
   if your local network uses 44.AAA.BBB.CCC as a tcpip packet switch.

There is a file (and a BOOK) by Ian Wade called NOSView that contains all
you need to get started. You may get the file by anonymous FTP from
UCSD.EDU. (in directory /hamradio/packet/tcpip/nosview... its about 600KB!)
Setting the system up right (and well) is not trivial... It must
be done correctly or nothing works right and you might screw-up other users
of the same net... but IMHO, it is worth the steep learning curve!

>>in interpreting the rules.

There is an ongoing muddle arising from the fact that transmission of
music (as audio) is forbidden, but transmission of video programs with
incidental music is permitted.

If ultimate intent is to prohibit "broadcasting of entertainment to
the general public" then the FCC needs to address the fact that some
of these video programs are no less "entertaining" than music would
be.

I would prefer seeing them drop the ban on music in bands where
fast-scan ATV is permitted (and where there is little need to conserve
spectrum).

Dear Packet Radio Group,

Does anyone know where in the United States I might be able to
purchase a copy of Ian Wade's "NOSintro: An Introduction to the
KA9Q Network Operating System"? I am very interested in getting

a copy of it as soon as possible. Any leads (addresses +
telephone numbers) would be greatly appreciated. Also, if anyone
knows of other introductions to ka9q (aside from what is already
at the UCSD.EDU archive) that they would recommend, I would
greatly appreciate it. Thank you very much.

I'm not sure where to get it or if it is on UCSD but Gary Ford has a
really good Nos intro packet that is available electronically. I have it
somewhere, e-mail if you can't find it anywhere else. It was sufficient
to get me running, and I was on ax.25 for less than 2 months at the time.

Someone (a group affiliated with DRIG?) was doing just this. The
problems they were working around was 32k DMA sizes and disk buffering
of the image. Another hurdle is getting the proper frequency for
sampling since the available clocks on the SM are not a multiple of
2400.

Still, they were getting great images out of it but it sounded like
there was still a lot of problems in making is plug and play.

And back to the original thread: by the time you have a sufficient
computer and software and another $100 for a board why would anyone
ever want to dedicate this to packet when you can do it easier and
cheaper with a TNC?

jv

: and should work.

It should be very feasable. I even have the format information for some
WEFAX, although it has not been added into my software yet.

I think that you are overestimating the requirements for the sampling
rate, although I don't know the exact details of the formats. 23Khz
will get signals up to 11.5 Khz, which is certainly better than the
audio passband on any of my radios :-). And if more is needed, the much
cheaper SB pro will sample to 44 Khz. For FM signals, the difference
between 8 and 16 bits will not matter.

For SSTV, which uses tones up to around 2400 HZ, I have had perfectly good luck
using 8Khz sampling.

: Yet another project (groan...).

Exactly. I got the information hoping to add WEFAX in an evening, although
that evening has not yet come.

I did the SSTV work because I didn't know anything about Digital Signal
Processing and wanted to, and for me having a real project is the best
way to learn. I admit up front that it is cheaper, easier and more
reliable to use purchased hardware if what you really want to do is use
it.

As I recall, Billy Lunt of the ARRL said all forms of packet networking
are legal, as long as the QSOs are via RF at either end.

I am aware of three sources for the book here in the US:

ARRL, Newington CT

CAPRA, Chicago (US mail orders only?)

Computer Literacy Books, Cupertino CA

I noted from a recent posting that TAPR is not carrying the book. It was CAPRA representatives that were selling it in the TAPR booth at Dayton (which is where I got my copy).

I have no connection with Ian or the publisher, but can recommend the book as being VERY helpful. I've been running the KA9Q software for a while now, but the book clarified a number of issues for me. I'd recommend it for anyone considering use of Phil Karn's software on most any platform - PC or otherwise.

Greg

I'd presume so, even though I'm not terribly familiar with the rules in
Britain. However, not all packet is at 1200 baud, just as not all ham
radio is CW. There have been major improvements in that area, and 9600+
bps is springing up in quite a few places.

>to/from licensed amateurs.. although I suppose my Linux box is connected to
>the local TCP/IP net so it is in theory an Internet host.. just not connected
>to the rest of the net, that's all :-)

Well, I guess that makes it an internet host, but not an Internet host.
Like my systems here at home. There's a small internet here, but it's
not on the Internet.

>>machine as an internet site as if it were a unix box ? I expect this
>>is in the FAQ :-)
>Hmm.. we don't actually have an FAQ, do we?? Just wondering..

My goodness, how short everyone's memory is! Yes, there's a FAQ, and I
post it on the 22nd of each month. It sounds like I should start posting
it more often, perhaps? I have seen 5 or 6 articles from people wondering
if there is one...

Anyhow, it will be posted next Tuesday, so I won't post it again now.
You can FTP the most recently posted copy from rtfm.mit.edu, in the
directory /pub/usenet/news.answers/radio/packet-faq. There is also a
mail server at rtfm, which can be addressed as mail-server@rtfm.mit.edu.
Send a message with only the word "help" in the BODY of the message
for a general help file on the server.

73 de KD6GGD, and see/hear you on Field Day! I'll even be doing some
packet.

No, it was the Field Engineer who cited the DeKalb police for transmitting
false and misleading signals by mounting an old radar unit on a road sign
to fool motorists into thinking there was a speed trap ahead.

I'd prefer the FCC to get out of the content regulation business
altogether. But that's not going to happen because of the political
situation. The urge to control and social engineer is too strong.
With the rise in popularity of talk radio, who's to say normal
amateur radio activities aren't entertaining the public. There's
certainly enough interest in scanners. Perhaps we need regulations
to make amateur talk less interesting. Naw! that's already the
case too often. :-)

This may be a dumb question, but since I don't know much about packet, here
it is--

Can I use my modem as a TNC? The modem in question is a Hayes 2400EC, with
V.42bis and MNP5. I'm thinking that it won't work, but I'm still curious.
Thanks in advance for your help.

The older Hayes smartmodems had a section in the back of the manual on how
to use them for packet. Basically, you need to put the modem into half duplex
and loopback mode so that it transmits and receives on the same tones. You will
have to shut off error correction and compression as well since they are full
duplex protocols and are not allowed by the FCC unless you are granted a STA
to use a non-standard protocol.

Some of these sound boards have an AGC on the input, though, which
you cannot disable through software. I don't think I'd care for
that on a digital modem design.

I get my elements from AFIT (Air Force Institute of Technology). Just
do an anonymous ftp to: archive.afit.af.mil (129.92.1.66 if no DNS),
and cd to /pub/space. There are lots of elements posted. The file you
probably want is amateur.tle.

Happy hunting!

With all this talk about a soundblaster, I thought I'd share this

THE HAMBLASTER DSP
"The first sound board designed exclusively for Ham Radio"

HARDWARE

The DSP25 is an inexpensive Digital Signal Processor that plugs into the 8 bit expansion port of an IBM PC or compatible computers. It provides audio connections to a receiver or transceiver for operating digital modes in the HF or VHF bands. It has an 8 bit TTL input/output port for interfacing to a Packet or all mode TNC. There is also a 16 bit I/O port on a 32 pin header connector to interface to a baby board which can contain a dual parallel DAC for connecting an X/Y tuning scope or other ancillary devices.

The Hamblaster can replace the TNC's analog filters, fsk demodulator or tone encoder. It can also be used as a digital audio filter for CW mode, a digital signal analyzer and a digital oscilloscope within the audio range. FSK signals are processed and converted to a TTL level to the 8 bit I/O port or they can be converted to an RS232 level and transfered to the audio out port. The FSK signal can be regenerated (eliminating 100% of the noise) and interfaced to a TNC's audio input using an analog to analog connection.

The A to A connection simplifies the "hook up" and still provides the advantage of improved error performance. The DSP25 consist of four basic circuits, the PC Host interface, a Texas Instruments 40 mHz TMS320C25 Digital Signal Processor chip, 32k words of RAM, and a Texas Instruments TLC32044C Analog Interface chip. It's constructed on an IBM PC/XT compatible 10" expansion PC board and the analog/digital connections are accessible on the rear bracket/panel.

SOFTWARE

The Hamblaster uses a DOS windowing software that is user friendly and provides several modem controls and congigurations. A Windows 3.1

compatible version is under developement and will be available in
October 93. Other software packages will include DTMF tone decoding
Adaptive filtering, FFT's, function generator and Music synthesis.

Some software features will include diagnostics, a digital oscilloscope,
demodulator and tone encoder control, adjustable carrier detect and
analog interface control.

The Hamblaster bus arcitecture is simple and micro-commands will be
available for third party software development.

TCP/IP numbers can be gotten via packet mail to ipnum@wb2psi.
There is a readdressing plan which I will gladly mail to
anyone who requests it. I can also post the complete packet
address if need be. Please send inquires via internet to
n2hkd@computronics.com or n2hkd@wb2psi.

We have distributed the readdressing architecture plan to as
many as we knew about. If there are any interested parties feel
free to contact me.

This is for the ARRL WNY region.

We here in Rochester are looking for other tcp/ip groups that
we can connect to and provide a larger network for.

Au contrare, if the AGC is reasonable, then it is a win. With an 8 bit
converter, you have only 48 dB of dynamic range, which is easy to over-run
if you aren't careful. With AGC, you become much less sensitive to
overload. Furthermore, many modem designs which use PLLs need AGC at
some point; if you don't have it in hardware, you have to do it in software.

Not quite correct. Ordinary packet uses Bell 202 tones. the Hayes 2400EC
doesn't support these. It uses Bell 212 tones at 1200 baud. The old
Smartmodem, which operated at 300 baud, had a section in the manual
about interfacing it to radio, but that was before packet came along.
Packet is HDLC while phone modems operate async. In short, forget about
using a Smartmodem for packet, it's not compatible with the packet
standards.

   I've freed up an Alinco 112t radio and want to mod it for 9600b. I
have a copy of CQ mag's May, 1993 Packet Users' Notebook with the mod
instructions for the Alinco 1200 radio. The instructions say to replace
the existing crystal filter with a wider replacement. Has anyone just
bypassed the filter all together? There are 3 pins on the filter. I guess
that they are in, out and ground. Any idea how to figure which pins
are what?
   Also, the 1200 'data' radio looks like pin 6 is audio. On the 112t,
pin 6 is n/c. There's no way to get to pin 6 to connect an audio wire.
Has anyone figured out if pin 6 is 'routed' somewhere else in the radio
so you could connect up the audio from the discriminator to pin 6 of the
mic connector? If I can't use pin 6, I'll have to cut the wire going
to the rear, speaker jack and use it.
   Thanks.

Thanks for all the responses to my question. It seems that my modem won't work
for packet after all (which I kind of suspected).

BTW, my callsign is N0NRO. Yes, it's codeless :-)

Later!

Hi there,

I would like to ask some question for a friend of mine (DG2YHM):

He is going to the U.S. in September for about one year as an exchange student. He will get a guest call in Texas (don't know the town, though) and will be restricted to the use of VHF/UHF frequencies that are allowed in Germany as well as in the U.S. He would also like to do packet radio there.

What he would like to know is the following:

- What frequencies are used for packet radio in the U.S. (esp. for Digipeaters on 2m and 70cm)

- Can he in any way whatsoever contact PR mailboxes in the U.S., preferably in Texas (i. e. now, from Germany)

- is the PR protocol used in the U.S. that same as is used in Germany?

- Is it possible at all to send a PR mail from Germany to the U.S. or vice versa?

If anyone can say anything to one of the above points, please email me (bsieker@techfak.uni-bielefeld.de) via internet(!).

If the answer to the last question is yes, Jost (i. e. my friend, DG2YHM) would be very glad to read from you on PR. So if at all possible, please send him a mail via Packet Radio.

Thanks inadvance,
Bernd, DG6YHI

Experimentation. It's a lot easier to try prototype new things with
software than it is hardware.

What if your TNC could distinguish between 2 different packet stations
transmitting at the same time?

What if your TNC could send 256 distinct tones so we could do bytes
per second instead of bits per second.

What if your TNC did some smart error correction/guessing so that
you didn't loose packets when a couple of bit's were missed?

What if you wanted to dynamically increase the baud rate of your
transmissions until you reached your radio's limit.

This are a couple of off the wall ideas. Maybe the're total junk. I
don't know. I am fairly certain that existing tncs will never be
able to do any of these things. Existing TNCs take care of all the
basics for you. All that comes out the RS-232 port is clean, no way
your going to change it, data. Maybe you can program the Z-80 chip
in the TNC to get some of this stuff going, but there's a lot more
8088 C programmers now than there are z-80 programmers.

When did the first TNC come out? 1983 or so? About the same time as
the IBM PC/XT? Compare todays PCs with the 1983 model. What do you
get? Compare todays' TNCs with the 1983 model. What do you get? I
think you'll notice a much greater change in the PC market than you
will with the TNC market. I just feel that maybe it's time to move
forward and see what we can do.

I need to locate any online information available for the G3RUH modem.
Any technical specifications, construction or operational details would
be greatly appreciated.

I am about to buy a second-hand ALL-01 universal programmer from Hi/Lo systems.
I have the following questions about it.

1. What is the latest version of the software? The version i will buy is from
   1989 and are there any later version?

2. Is it possible to program AMD's PALCE circuits on it?

3. Can somebody give me the Fax-numbers to the manufacture HI/LO systems?

>: and should work.
>
>I think that you are overestimating the requirements for the sampling
>rate, although I don't know the exact details of the formats. 23Khz

I blew it. You don't need a 20+Khz sampling rate to do wefax.
Assumptions:
     240 LPM (lines per minute)
     Super-duper-VGA at 800 dots per line.
     8 bits (256 gray scale) images.
Calcs:
     240 LPM = 4 lines/sec = 250ms/line
     800 dots/line is actually approx 1000 dots/line to include
       start tones, sync, borders, etc...
     (250ms/line) / (1000 dots/line) = 250us/dot = 4 Khz

Therefore, you only need to resolve 8 bits at 4Khz sampling rate.
Looks easy...

What had me confused is why one needs a 30Khz wide receiver to get
a decent picture. Some of that (approx 5Khz) is to compensate for
doppler shift. With only a 2.4Khz FM tone running at approx 1Khz AM
modulation, one would wonder why one needs 30Khz of bandwidth. It's
partially to keep the distortion to a minimum so that IR measurments
are reproducable. I also suspect that it was a hangover from the
old wide-band FM radios of the 1960's. Does anyone know what the
deviation of the 2.4Khz vhf wefax tone is suppose to be? My Cushman
CE-6 doesn't hear well enough to measure it.

Dear OM, I expect that someone will need to know exactly where
your friend is going to be to be able to answer your questions.
Packet is often found on 145.01, 145.03 and 145.05 Mhz and
AX.25 usually works if you are in range of someone who is
set up as a digipeter. There are rather extensive networks
with 2m and 70cm user ports in many parts of the country using
netrom and other systems. Packet mail put into one of them thru
a PBBS should eventuall make it to Germany. If he is going to
college, he might be better off trying to communicate on
internet thru the college for anything that must be sure to
be delivered.   73   Bill

1200 bps packet is sent on VHF with 202 modem tones. A few commercial
modems are capable of that - it's what's used for caller-ID - and can be
put into a 202 mode. Most can't. You would ALSO have to put the modem
into a synchronous mode and employ either hardware or software HDLC
decoding in your computer.

We early packeteers indeed used Telco-style 202 modems to get started
with packet, so it can be done. There used to be lots of 202 modems in
the electro-junk stores, but I'll betcha they've mostly rusted away by
now. 202 is old technology.

9600 bps packet is sent using direct RF FSK with a pseudo-randomizer to
distribute the energy in the channel (a so-called 'scrambler'). I don't
know of any commercial telephone-line modem that can do that. Again,
it's HDLC too.

Interesting... I didn't know they had Bell-202 modes? Has anyone done
this? I see a few requirements:

1- must be able to run 4 wire, switch directions quickly (under rts
control??), OR have a good hybrid.

2- must have some way of keying transmitter (using line relay in modem??)
3- needs some baycom style software (unless there's some smarts in the
modem rom I don't know about).

I have an original Hayes Smartmodem 1200 and 300. Alas I have manuals for
neither!

Has anyone done this???

The info I have is about 3 months old, but here goes:

Chicago Area Packet Radio Association
PO Box 8251
Rolling Meadows, Illinois 60008

I'd first send a message to

CIS: 70040,125@compuserve.com

Internet: JCHESNER@holonet.net

The cost was $22.50

   And back to the original thread: by the time you have a sufficient
   computer and software and another $100 for a board why would anyone
   ever want to dedicate this to packet when you can do it easier and
   cheaper with a TNC?

God forbid someone might do it themselves and learn something instead
of just buying it off the shelf like hams are supposed to.

Rich

Where can I find autoexec.nos? I received KA9Q from the Simtel20 CD.
There are only 16 files on there and the executable just contains
NET.EXE. So where is this essential file?

Frequently Asked Questions for Amateur Packet Radio

Version 1.14 - Last modified 6/1/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet
issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to
rec.radio.amateur.packet. The current version of this document is
available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site
rtfm.mit.edu in the directory pub/usenet/news.answers. The name under
which a FAQ is archived appears in the Archive-Name: line at the top
of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

   3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain

CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and

drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format

44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses

separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my

attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The

FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion

of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

```
telnet knuth.mtsu.edu 372

    or

telnet 161.45.1.1 372
```

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites are available for getting packet radio

information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes

available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

TCP/IP doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol (called IP) on top of AX.25. This is used to increase efficiency of its transmissions, since IP does not require packets to be "reliable", that is to say, guaranteed delivered error-free. TCP handles the retransmission of lost and garbled packets in its own way, at a higher level. Therefore the extra information in an AX.25 "VC" (virtual circuit) frame is not useful, and thus consuming needed bandwidth.

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network

schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can

be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

You write it yourself to customize your system. Read the manual. Look in the
/hamradio/packet/tcpip/docs or /hamradio/packet/tcpip/pa0gri for a decent
set of documentation....

autoexec.nos is read by the program at start up and initializes the whole
thing.....

>technology I have a few questions to ask the microwave gurus. First,
>a little background: This project will link two computers together
>through their serial ports at initially 9600 baud but later at speeds
>of up to 115K baud. The eventual goal is to use SLIP through this
>connection to get onto the network. The distance will be approx.
>10 to 15 miles.
>
>1. Where is a good place to get cheap microwave components from?

Hamfests, fleamarkets, the dumpsters of phone companies, TV stations,
and the power company are the cheapest sources. Advanced Receiver
Research sells new 10 GHz and 24 GHz Gunnplexers, but I wouldn't
call them cheap, about $400 for 10 milliwatts.

>2. What frequencies can be used for this microwave link? HAM?

Naturally, microwave links use microwave frequencies, duh. For
speeds from 1200 to 56 kilobaud, any ham band above 222 MHz will
do. That's UHF. For speeds greater than 56 kb, any ham band above
450 MHz will do. Commercial terrestrial links are generally found
in the 4-7 GHz range.

>   Are there allocated frequencies for such experimentation and
>   do they require a license?

All the bands, except the 900 MHz Part 15 band require licenses, and

it's limits aren't suitable for your project. Naturally the ham bands require a ham license. Most of the commercial frequencies are in heavy use. You have to go through a coordinating body to get an allocation approved before the FCC will consider a license in the commercial services. This can be expensive and time consuming. An experimental license is less restrictive, but one will be issued only "for cause" by the Commission. You have to give them a written proposal detailing the types of experiments you intend to undertake. If they consider it interesting, and if they agree that no other type of license is suitable, they'll issue you an experimental license, but the burden is on you not to interfere with any other licensed user.

>3. If I want full duplex, do I need 2 antennas at each end or can
>   one serve as a bidirectional with 2 separate frequencies used?
>4. Can one antenna be used to transmit AND receive (related to question
>   3 and 5).

It depends on the type of feed system you use, and on whether you wish to operate split frequency or not. Split frequency operation is common in amateur use, the dish doesn't care, and the feed doesn't care as long as the two frequencies are in the same band. Commercial practice is usually to operate on the same frequency, but with different polarization. Satellite systems operate this way with half the transponders running vertical polarization, and the other half on the same frequencies but horizontally polarized. Left and right hand circular polarization can also be used. A single feed can be used for both polarizations by suitable design. You can use two dishes and two feeds on two different frequencies if you wish, but it's inefficient to do so.

>5. Which antenna do I use? Horn? Dish? (related to question 2 about
>   frequency).

For your application, a dish is preferred. Practical horns with more than 17 db of gain are difficult to manage mechanically. Doing cross polarization with a single pyramidal horn is also tricky. You'll likely want to use a sector feed at the focus of a dish.

>6. Has this been done before with personal/amateur setup?

Sure. See the 1993 ARRL Handbook, or one of the Computer Networking Conference Proceedings, also available from the ARRL.

>7. Where can I find out more info on this stuff?

See above, and also the RSGB microwave books will be useful for the RF part of setting up the link.

>8. What security considerations are necessary? I will probably want
>   to encrypt/scramble so eavesdroppers can't get system passwords etc.
>   Is there data encryption on a chip available?

Encryption is illegal on the amateur bands, but it's fine on commercial links. DES chipsets are available, but there are better, and cheaper,

ways of insuring communications privacy. On the cheaper end, a simple
data scrambler using a tapped shift register should supply the minimal
security you probably really need when coupled with the tight beam
point to point nature of your link. On the high end are certain public
key systems that the government doesn't like because even they can't
break them. This can be implemented in software, so your hardware
costs can be kept to a minimum.

>9. Is it feasable to use data compression or correction like v.42 and
>   v.42bis? I have seen it on a chip but have never used it before.
>   Are these chips very expensive? Is there a real easy way to error
>   correct that's cheap?

KA9Q has an experimental forward error correction scheme for NOS that
he writes about in this month's QEX. It requires no special hardware
other than a 33 MHz 486 host to implement at 56 kb. There are dedicated
chipsets available as well, but they aren't cheap yet.

>10. Since I'll be using SLIP at my end I guess the other end can be hooked
>   up to any machine on the network? (ie. a SUN, but what about an
>   IBM PC or Amiga that is not running UNIX?)

Run the appropriate KA9Q NOS varient for the platform. There are versions
for PCs, Mac, Amiga, and who knows what else floating around. This is a
good plan for interoperating with any network since NOS can switch packets
from radio, wireline, or ethernet at will. The Telebit Netblazer is nothing
more than a customized PC running a hacked version of NOS.

>I know this sounds really complicated but that's why I want to do this.
>Plus it can be very useful, but I don't have too many high hopes on getting
>on the network because of the network administrators security concerns.

This isn't that complicated, some of us are interconnecting networks
with this technology today. 56 kb RF modem kits are available from
GRAPES, 19.2 kb radio links are available from Kantronics, and 9600
baud links are available from a number of sources. Commercial T1
rate microwave equipment is also available from a number of vendors,
or you can try the system described in the Handbook. 15 mile line of
sight microwave paths are duck soup. Even an eye safe laser and a
6 inch telescope would be suitable for the task, and lightwave
communications is still license free.

The possible approaches to licensing would be...

(1) A ham license, IF the project is 100% NON-COMMERCIAL and not
business-related in any way.

(2) The FCC has a special licensing program for school projects.

(3) Otherwise, there is FCC experimental licensing for commercial
users...

What is "ampr.org" an abbreviation for? If all Ham radio
internet addresses belong to this domain (?), why is it necessary?
Will the Internet-with-a-big-I understand these forms of addresses?

Sorry, I am rather ignorant of all the internet addressing-routing-etc.
thoery.

In article <1993Jun12.124123.21140@uhura.neoucom.edu> wtm@uhura.neoucom.edu (Bill
Mayhew) writes:

>at the prime focus. Apartment building Satellite Master TV Antenna
>(SMATV) systems often mount two feed horns side-by-side so as to
>enable reception of all 24 H and V trnasponders from a single
>satellite; with a small 2.3-3.5 meter dish with a farily low focus
>to diameter (F/D) ratio, the focus is loose enough you can get away
>with it.

     I have never seen this anywhere. The standard device for
receiving both polarizations on one TVRO dish is called an orthomode
feed; orthomode feeds use a common circular waveguide scalar horn (the
thing with the rings of ridges) and two mode couplers (or probes) that
couple to standard rectagular guide for input to the LNB's. Usually
these are oriented at 90 degrees for the two polarities. A standard C
band scalar horn is much bigger than the focal difraction disk of a
typical .4 F/D dish and two side by side scalar horns wouldn't work at
all. Neither one would get much of any signal.

     What you do occasionally see is two (orthomode) scalar feeds
each somewhat offset from the focus of the dish and each used to get
signal from a separate satellite spaced nearby on the Clarke arc. This

is not at all uncommon for cable or SMATV headends since most cable services are currently on satellites on the west end of the arc that are two or three degree apart, and the loss in gain due to coma from the 1 degree or 1.5 degree offset feed position on a 10 foot or 12 foot dish is not enough to cause serious signal degradation. There are some systems that use 3 feeds on one dish for the current constellation of west end of the arc cable satellites. This is also sometimes done with spherical rather than parabolic reflectors and sometimes the offset horns are oddly shaped to correct the phase distortion due to the offset from focus.

     David I. Emery, Senior Technical Consultant (and notorious fraud)

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: --

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are

ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

        NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

Subject: I need to borrow your TNC and ht for a minute pls.
Message-ID: <1993Jun13.154936.23223@gsm001.mendelson.com>
Summary: Check TNC for radiated noise.
Keywords: TNC, noise, QRM
Sender: usenet@gsm001.mendelson.com (NNTP Poster)
Nntp-Posting-Host: gsm001.mendelson.com
Organization: Mendelson.com
Date: Sun, 13 Jun 1993 15:49:36 GMT
Lines: 33

Hi, I just purchased an MFJ TNC.

My problem:

It radiated noise on 144.990 (the one packet frequency I need) enough
to block signals completely up to about 50 feet.

I noticed that the ground connections on the case were poor at best, so I
removed the paint where the top and bottom and the front and bottom meet.
I added clamp on rf chokes (square toroids?) on the radio and power
cables. I also tweaked the clock oscilator crystal to move the harmonics
off frequency.

The result is that I can now use 144.990 with the antenna about 15 feet from
the tnc.

This is fine except for portable packet.

Now my request:

If you have a TNC and an HT would you pls set your HT to 144.990 and
measure how close you can get to the TNC without any signal on the HT.
```

Please let me know what your results are, if you respond by email, I will
post a summary.

Thanks and 73

Geoff.

 amateur packet radio (organization)

> If all Ham radio internet addresses belong to this domain (?), why is it
> necessary?

Because the ampr.org (44.) network is made up of many subnets, including
countries, states/provinces, and metropolitan regions. Any routing system
needs to know where something is to get a data packet to its destination.
Since ampr.org is part of the larger internet, the addressing scheme
identifies not only the locale (in the case of our net) but also the fact
that the station/node is amateur radio based.... (there are other .org
addresses).

 > Will the Internet-with-a-big-I understand these forms of addresses?

Absolutely!

You described this as "radiated noise". Do you mean a carrier?
If so:
This is fairly normal. Most all TNCs put a signal out "somewhere". All
you need to do is retune the oscillator frequency slightly to move it
to some other channel that you don't use. Some manuals even tell you
this. Personally, I tune mine with a counter to the exact specified
clock frequency so that the realtime clock will run properly. Since it
doesn't land on .01, I have never checked to see where that puts it.
The clock frequency is not critical for anything else and can be moved
substantially with the resulting percentage of error remaining very
low and having no effect on operation.

Hello:

Please get me some advice on a problem that I have with TCP/IP. I
have KA9Q NOS version 911229 (PA0GRI v1.8b) that I am using with an
MFJ -1278 TNC (revision 9 board) under KISS mode. I am using a
386/40 clone under DOS 5.0.

I can do ax25 connect sessions, but nothing else seems to work
properly. For instance, when I try an FTP session with another host,
I find that my station will call out and get a response from the
station I am trying to connect with. Once we have each exchanged
a single packet, there is no further reply to my transmissions. I
am using the following trace command to arrive at these conclusions:

    trace ax0 0211 spool\trace.txt.

I have read several BBS manuals on TCP/IP and have tried three versions
of KA9Q NOS. I have tried using a "vanilla" configuration (minimum
autoexec.bat and config.sys), and seem to get the same results each
time.
I don't think it is the computer, and I followed the instructions to
set up autoexec.nos and domain.txt. I have a feeling that either it
is the TNC, or something wrong in my autoexec.nos file.

I have been at this for weeks, and I have run out of things to try.
Any help would be greatly appreciated.

Now that I have a 486-33 machine and can run PBBS software in the
background, I'm thinking of starting and operating a packet BBS system.
But I'm not sure what software is out there and what the different
features are. I guess I'd like a program that will use my system's
capabilities to the maximum (while still allowing me to run other software
in the foreground).

I downloaded a program called FBB515.ZIP. I think it's from France. Is
this a good program? What others are available and can I FTP them?

I have a Kantronics KPC-3.

Thanks for the advice!

Now here's a good question. At breakfast today my friend and I were
talking about possibly installing a 10GHz link between my house and his
(about 1.5 miles apart) and using it as a SL/IP connection.

Now I know that profane/obscene material isn't permitted but all the
stuff is sent compressed and unreadable unless you're running uucico
etc. What is the legality of this? I mean, music can be transmitted, as
digital (midi files, etc) so what would the issue be with passing
alt.sex.stories in coded format? Just out of sheer curiosity of course.

And a SL/IP connection stays up all the time. Would this be
considered as broadcasting even if you ID'd all the time? There are alot
of "if's" to consider when passing data over amateur radio frequencies.

Hello

I am also looking into becomming a ships radio officer. I am currently studding for the genral raidotelephone operators license w/radar endorsement. Any help would be GREATLY apreacated especialy with any book recomendations.

Thanks
Marc Spitzer
marc@src4src.linet.org

ps I have the following:
1) general radiotelephone operator's license study guide 2nd edition
by thomas lebanc, nx7p

2) radio operator's licence Q&A manual 11th edition
by milton kaufman

>addresses).

Sorry, this is just wrong and worse, misleasing. You confuse two
different concepts that will just make it more difficult to understand
what's going on. AMPR.ORG has nothing to do with the class-A network
44.0.0.0. It just so happens that the vast majority of address
records in the AMPR.ORG happen to be on the 44.0.0.0 network, but
certainly not all of them. Conversely, there is nothing preventing me
from putting my NeXT at home, wa3ymh.umd.edu, on network 44.0.0.0
either.

Think NAMES, ADDRESSES, and ROUTES. These are seperate and distinct
concepts.

Names (foo.AMPR.ORG) allow you to attach a friendly label to things.
They don't necessarily tell you anything about where that thing is or
how to get to it. (Domain) Names are assigned and structured along a
purely administrative heirarchy that doesn't have to reflect network
topology.

Addresses effectively tell you "where" on the network a thing is. The
adddress is assigned consistant with how subnets are desisgned, and
you must have a proper address that corresponds to the place on the
network topology that you plug in to make it "work". Addresses are
thse 44.0.0.0 things.

Routes tell you how to get to an address from where you are now. They
are either maintained manually or automatically by using routing
protocols.

> > Will the Internet-with-a-big-I understand these forms of addresses?
>
>Absolutely!

Nope. I suspect that the Internet as a whole is somewhat ignorant of
how the 44.0.0.0 address are assigned and how network 44.0.0.0 routing
(such as it is) can be used.

On the other hand, AMPR.ORG domain names can be happily resolved since
there are AMPR.ORG name servers (at least for most of the AMPR.ORG
domain) on the Internet.

Can anyone give me any recommendations on cheaper (<$200) TNC's?
I don't need anything especially fancy. Since I am here in Israel,
I have to get a friend back in the USA to buy it for me and send it,
so I can't do any tire-kicking to help me decide.

P.S., The ability to work with a reasonable number of satellite modes
would be a plus.

Jack Snodgrass (kf5mg@iinus1.ibm.com) wrote:
:   Does anyone know what issuse of what magazine had the blurb about
: doing SSTV using a SB board? Has anyone contacted the program's author
: to discuss doing something similar with packet instead of SSTV. Thanks.

As I mentioned in a previous post, I have looked into it. I have had a
working sound card SSTV system for more than a year, but lack of time
has prevented me from putting the final touches on it and then marketing
it/sharewaring it/giving it away. It currently does not talk to
soundblasters, but to something else (a long story), but I have working
routines to talk to a SB, and guestimate it would take me a couple of
evenings to make it work on the SB. Unfortunatley it has waited almost
6 months for those evenings :-(.

For packet, I think that the best place to start would be the Poor Mans
Packet (PMP) software which does almost all the work of the TNC in
software already but requires external hardware to detect frequency
(1200 or 2400 HZ) - one bit of input only. It should be straightforward
to replace the routines which talk with the hardware with routines that
look at the soundblaster data stream. I even went so far as to get the
PMP sources and a Turbo C compiler to work on this project.

Someone has made the point that the soundblaster is not full duplex (cannot
send and receive at the same time). While this is true, I'm not sure it
is relevant, since my radio is also not full duplex either.

If there is sufficient interested from people with the time and talent to pull
this off, I might be talked into finding the time to finish the SSTV
software and distribute it as shareware or something.

: Anybody know what DSP chip is in the Soundblaster Pro?

The chip on the SB Pro isn't much of a DSP. But you can use the CPU of the
PC the SB is in as a DSP. For my SSTV software, my 25 MHZ 386 SX can do
the computations required for SSTV receive in better than real time. I would
expect similar requirements for the simple packet modulation techniques. The
fancy ones would require considerably more CPU.

Hi,

I have two MFJ TNC's for sale:

1) MFJ 1274 Packet TNC. Has HF tuning bar. With AC adapter $75

2) MFJ 1278 multimode (Packet, RTTY, AMTOR, FAX, etc) with adapter
and original box. $150

I have manuals for each.

Please call:

     (302) 834-8685 between 3:30pm and 9:00 Eastern

BTW these prices are firm, and am willing to split shipping cost and send
COD.

Strictly speaking, all such transmissions are prohibited, even the
midi sequences. The rules don't specify the format, only the content.
Practically speaking, the *intent* of the regulations is to protect
the public, using unsophisticated equipment, from being exposed to
indecent materials, and to restrict broadcast type services. So a
compressed data stream is just a data transmission that's unlikely
to be hassled.

>And a SL/IP connection stays up all the time. Would this be
>considered as broadcasting even if you ID'd all the time? There are alot
>of "if's" to consider when passing data over amateur radio frequencies.

There is no legal limit to the duration of an amateur contact. As long
as the 10 minute ID rule is observed, a control operator is present
(unattended operation is permitted under special conditions), and the
transmissions are intended to be point to point between amateur stations,
there's no problem with semi-permanent connections.

>Any help would be greatly appreciated.

Are you in the domain.txt of the stations you are attempting to
contact? And do they have a cluster route entry for your address
subdomain? If not, you'll get a response to your ARP request, but
the other station will not know how to route IP packets to you
and will have what is called a "half open" connection with you
that is strictly one way.

Note that ARP requests are addressed to QST and serve to map IP
to AX25, but they don't automatically establish a reverse route
for IP packets. That's a function of the individual routing tables
in each host.

Gary

louie@sayshell.umd.edu (Louis A. Mamakos) writes:
>Nope. I suspect that the Internet as a whole is somewhat ignorant of
>how the 44.0.0.0 address are assigned and how network 44.0.0.0 routing
>(such as it is) can be used.

As a whole, the Internet is as unaware of the internal structure of
network 44 as it is of any other attached network. That's how it should
be. That our network 44 is a bit more bizarre than most internally is
unimportant.

What the Internet-as-a-whole DOES know is that it can reach network 44
by routing packets to one of our campus gateways, which is a Cisco
router that forwards the network-44-destined packets to a PC that lives
under my desk.

That pc is responsible for taking the network 44 packet, examining a
routing table that I don't update often enough, and if a further
route is known, encapsulating the IP packet for transport to that
further router.

Those further routers may forward, swallow, or discard the packet.
If the packets pass certain security barriers, they may even be sent
somewhere via radio.

And that's how it works.

I got my packet station running with an Icom HT, and have quickly
found that it is woefully inadequate. I was wondering if anyone
had suggestions on what radio to get. I had heard that the
Motorola Micor or Mitrec radios would be a good choice. I want
something that can be dedicated to packet use, so I don't need all
of the fancy synthesized tuning, PL and DTMF stuff. I hope to upgrade
to 9600 soon, so I would most like to have a radio that could be modified
for 9600.

Thanks for your help

  Does anyone know how to modify an ICOM 22S diode programmable radio
such that it will receive frequencies other than those in multiples of
0.050 MHz. (I want to work packet on 145.010, and .070, but this radio
in its current unmodified state will not tune to those frequencies.)
I would like to work packet on .010, .050, and .070, but do not have
much money!
   Also, I am using an MFJ 1274. What is the fastest speed it will
currently send data (baud), and what type of external add-on can I get
for it to improve its speed. Will the radio work at this speed?
  Thankyou very much for you help!

Actually, the FCC's intentions are clear, and are not quite what you
said. Transmission of descriptions of music is OK so long as the music
cannot be directly demodulated as such with ordinary radio equipment
-- that is, you can transmit all the MIDI sequences you want, but don't
transmit music as audio on FM, AM, or SSB.

Transmission of obscene or indecent material is prohibited regardless
of the method of encoding. This, at least, seems to follow from various
FCC rulings that "not only obscene words, but also _their meanings_
[however expressed], are prohibited."

I'm a newcomer to the packet world, so these questions might be naive...
June's QST had a short article about a portable packet system using an
HT and a Sharp Q-series pocket organizer. The gent who created this used
it solely as a "dumb" terminal for PBBS use. I would like to go further
and create a portable TCP/IP node using an HP100LX running (I suppose)
KA9Q NOS, connected to some sort of TNC. My questions:does the 100LX have
enough horsepower to handle something like this? What kind of TNC should I
purchase? What's the max bps I could expect to see? As to the TNC, I have
an AMiga at home, what would be a good item to do double duty as part of a
portable setup and connected to my AMiga? Any info from the gurus so I don't
blow time and money on a cool but unattainable idea will be gratefully
accepted... Oh yeah, the transceiver for all this is a Kenwood TH78A.

Many thanks,
          Tim

A well-compressed data stream is indistinguishable from an encrypted
message. And, with the the "right" key, you can pull any plaintext
out of a random data sequence. I.e., the same string can be decoded
as your typical no-content QSO, hard-core porno pix, or your favorite
heavy metal band. It is a standard crypto technique to disguise "bad"
info as harmless text.

So what's the poor FCC to do? Write the "compress" or "zip" spec into
Part 97? If the real intent is to protect innocent ears, I think any
common data compression is OK; if it's to prevent secret communications,
then allow only plaintext. But even plaintext is suspicious. I think
we have to outlaw ham radio... :-)

And exactly *where* in the rules does it say that? Part 97.113(d)
flatly prohibits the transmission of music. It does not specify a
modulation encoding. This part deals strictly with content, and
not the method used to convey that content. In practice, the intent
of the regulation is to stop amateurs from competing with broadcast
stations, though that's also covered in the prohibition on one way
transmissions, but the wording of the regulation applies to the content,
no matter what modulation encoding is used. In fact the prohibition
is in the same sentence with the prohibition on obscene, indecent,
or profane words, language, or meaning. And it also shares the
sentence with the prohibition on using codes and ciphers to obscure
meaning. None of these specify particular modulation encodings.
To one with the proper receiving equipment, midi sequences are
transmission of music just as much as an alt.sex.picture transmission
is a sending of indecent material for someone with the proper viewing
equipment.

Now as I stated above, I don't think you would be hassled about this
unless someone filed a complaint. The FCC doesn't make a practice of
trying to decipher the content of every digital transmission it monitors.
One binary transmission pretty much looks like any other on the spectrum
analyser.

Gary

Louis, (and all),

You are absolutely correct in most ways.... but... to explain this
comprehensively, we really ought to have a good amateur oriented "hitch
hikers guide to the Inet".... I don't have time to write it... I have
found that most hams comprehend the "regional subnet" explanation pretty
well although it is grossly oversimplified.

The only place I take issue with you about Internet knowledge of
ampr.org is on the business of address resolution and routing...

You might wish to talk to Brian Kantor about this... but my
understanding is that UCSD.EDU is the authoritative DNS for ampr.org
(yes, I know some addresses are not 44.xxx!) and mirrorshades.ucsd.edu
takes advantage of the currently expanding gateway system to act as a
router to those subnets of ampr.org that *are* connected.

I can't understand why things work so well for me here otherwise! When
mirrorshades is working, I can get from my uthscsa.edu hooks to anybody
on the gateway system that has their TNC turned on (where the local
firewalls have been specifically adjusted for me!)... tracerte tells me
that I use mirrorshades to do it and thorin (my local DNS) resolves all
my ampr.org requests using the tables at UCSD.EDU....

Yes. It does seem silly. But a vote is how we resolve issues where a
concensus isn't possible. The vote has decided it.

If there's any benefit, the digital radio people can try again in 6 months
without (as much?) interference from the rest of rec.radio.amateur.

I am trying to connect my Kantronics KPC-3 to a Yaesu 736 but since purchas, I
seem to have misplaced my 'Getting Started' manual. Would anyone happen to
have the details as to how to preform this connection?

73,
Eric N8UNN

If you can do SSTV with a SoundBlaster, would WEFAX (HF FM fax or
VHF AM fax) be feasable? The 23Khz maximum sample rate of the
8 bit SB100 (bottom of the line) is probably marginal for
VHF AM. However, the 16 bit SbPro version will go to 44Khz
and should work.

Yet another project (groan...).

Indeed, one could not, under that opinion, legally send images of sheet
music, or speak sequences of notes over ham radio.

Luckily, however, the rule of law is tempered to justice by reason.
